Jabra Elite 25e Wireless IEMs

Classy and bassy

Catering to both, music lover and professionals on the go, the Jabra Elite 25e makes for a pretty decent pair of headphones utilising the neckband design. What's good about the Jabra Elite 25e is that it has quite interestingly improved upon some of the shortcomings of the neckband design while staying classy. As is the trend with most audio devices these days, Jabra has included support for Google Assistant and Siri. All of these have been included for a price of ₹3,999.

The Jabra Elite 25e makes use of a variety of materials to ensure a balance between practical design and good looks. The ear buds are

magnetised so that they stick together when not in use. And since it's easy to detect when the two buds have been brought

together, Jabra has managed to make use of this to slip in some neat functionalities. You can answer a call by pulling the ear buds and similarly, you can bring them together to stop music playback or terminate a call.

The Jabra Elite 25e forms a pretty decent seal once properly worn and the overall sound signature weighs heavily on the lower frequencies. The highs and the mids are properly reproduced with minimal distortion. Even with the volume turned all the way up, we didn't notice any significant distortion. When we ran it at peak volume level, it lasted us just over 16.5 hours which seems to be quite decent. However, in terms of real world usage it lasted about 2.5 days easily.

—Mithun Mohandas

Cooler Master MasterCase H500P

A legend makes a comeback

The most striking detail about the H500P are the two 200 mm RGB fans on the front. But the front panel is lined with plastic, restricting the airflow. This limits the potential of the H500P. Speaking of the panels, both the top and front panel which are too flimsy. Even a slight jerk pops out the top panel. The pre-installed 200 mm fans on the front support RGB lighting. However, in order to enable RGB, you will have to connect the four-pin RGB connector directly to your motherboard otherwise you won't get RGB lighting. Only newer motherboards support these new RGB headers. Apart from the exterior panels, the interior has good build quality. The

tempered glass side-panel has an easy removal and insertion process, but the screw holding the panel to the cabinet felt too tight.

The H500P does perform quite well. The Intel Core i7-4096X stayed stable at 34 degrees Celsius

without any load whereas it jumped to 59 degrees in our Prime95 stress test. The Sapphire Radeon HD 7790 GPU sat at 35 degrees when idle and the Furmark 1080p present benchmark pushed the temperature to 64 degrees. Essentially, the temperature delta was comparatively low among all the cabinets that we tested last year.
