VIDIA's GTX 1070 Ti launch came roughly 16 months after their Pascal lineup debuted with the GTX 1080 and the GTX 1070. We've seen new GTX TITAN cards and even Ti variants release since

then. The GTX 1070 Ti came as a reaction to the Radeon RX Vega 56 which sat sans any competition between the GTX 1070 and the GTX 1080. The GTX 1070 Ti is based on the same GP104 that the GTX 1070 and the GTX 1080 are based off of; however, it offers four more active Streaming Multiprocessors (SM) than the GTX 1070 which makes a world of a difference in performance. If you already have a GTX card above the 1060, then you're better off waiting for the next GPU architecture launch from either company. However, if you're set on getting a GTX 1070 Ti, then allow

us to compare two of the best cards in the market to give you some perspective.

The performance difference between the GTX 1080 and the GTX 1070 isn't that much. So when you add another card between them, a new dilemma arises - pricing. You can neither price it too high since that would equal the GTX 1080 (a much better performer), nor can you price it so low that it competes with the GTX 1070. Moreover, when board partners release custom designs, you'd probably have certain 1070 Ti cards equalling the GTX 1080 in gaming. Getting the GTX 1080 becomes a no brainer in such a case, however, marketing the GTX 1070 Ti becomes a royal nightmare. So all NVIDIA GTX 1070 Ti cards are shipping with the same base clock speed of 1607 MHz and boost clock of 1683 MHz. This makes folks wonder why they'd even go with cards
