GAMING PERFORMANCE

ASUS ROG STRIX GTX 1070 TI

Here's the FPS table for some of the games that we benchmarked on the ASUS ROG STRIX GTX 1070 Ti.

- Witcher 3 - 85.2 FPS
- Battlefield 1 - 86.7 FPS
- Middle Earth: Shadow of War - 63.5 FPS
- Tom Clancy's Ghost Recon Wildlands - 66.7 FPS
- Tom Clancy's The Division - 68.9 FPS
- Destiny 2 - 71.2 FPS
- DOOM - 132 FPS
- W40K: Dawn of War - 82.4 FPS

ZOTAC GTX 1070 TI AMP EXTREME

Subsequently, the same on the ZOTAC GTX 1070 Ti AMP EXTREME Edition.

- Witcher 3 - 84.6 FPS
- Battlefield 1 - 85.8 FPS
- Middle Earth: Shadow of War - 62.5 FPS
- Tom Clancy's Ghost Recon Wildlands - 65.6 FPS
- Tom Clancy's The Division - 68 FPS
- Destiny 2 - 70.3 FPS
- DOOM - 132 FPS
- W40K: Dawn of War - 80.1 FPS

SYNTHETIC AND COMPUTE BENCHMARKS

ASUS ROG STRIX GTX 1070 TI

Synthetic benchmarks tend to push the GPU to its limit. However, despite the fact that there are more SMs, you have a similar ROP count, which means we're going to see similar scores in some benchmarks.

- 3DMark Fire Strike - 17461
- Time Spy Score - 7158
- Time Spy Graphics Score - 6899
- Blender - 57 Sec
- CompuBench Optical Flow - 46.2 MP/s
- Geekbench 4 - 190751
- Folding @ Home (SP) - 102.6
- TessMark - 371.1 FPS

ZOTAC GTX 1070 TI AMP EXTREME

It would appear that most of the compute and synthetic benchmarks we tried out gave more or less the same scores on both cards as was predicted. Playing around with just the GPU clocks doesn't result in much of a difference. Changing the memory clocks is going to produce a significant change.

- 3DMark Fire Strike - 17343
- Time Spy Score - 7174
- Time Spy Graphics Score - 6922
- Blender - 57 Sec
- CompuBench Optical Flow - 45.9 MP/s
- Geekbench 4 - 190744
- Folding @ Home (SP) - 102.6
- TessMark - 372.4 FPS

CONCLUSION

The GTX 1070 Ti launch is a rather lackluster one. Given the very narrow envelope within which all custom GTX 1070 Ti cards have to operate, we are left with a smaller set of third-party cards which perform more or less in the same manner. The ASUS and ZOTAC cards are very evenly matched. The ASUS card has fewer gimmicks since it did not throw in an additional power connector and extra phases knowing well that they would not be put to use because of the restrictions placed on this GPU. ZOTAC, on the other hand, provides us with the same configuration that we've

seen with many AMP EXTREME cards before. There's a lot of potential in the board. Alas, the FireStorm software doesn't have profiles baked in and the user has to jump through a couple of extra hoops to get the job done. It isn't that big a hurdle for someone who's used to playing around with GPU configurations but for the average Joe, it becomes very difficult to pick a custom graphics card over the existing NVIDIA reference card. For what it's worth, ASUS has the upper hand between the two cards, even though it is by a very small margin. [4](#)
