

Google Firebase

A backend-as-a-service platform for your app

F

irebase gives you the tools to develop high-quality apps, grow your user base, and earn more money.

We cover the essentials, so you can monetize your business and focus on your users. To add Firebase to your Android Project, you need a device running Android 4.0 (Ice Cream Sandwich) or newer, and Google Play services 11.8.0 or higher.

Add Firebase to your app

If you're using Android Studio version 2.2 or later, the Firebase Assistant is the simplest way to connect your app to Firebase. The Assistant can connect

your existing project or create a new one for you with all the necessary gradle dependencies.

To open the Firebase Assistant in Android Studio

- Click Tools > Firebase to open the Assistant window.
- Click to expand one of the listed features (for example, Analytics), then click the provided tutorial link (for example, Log an Analytics event).
- Click the Connect to Firebase button and add the necessary code to your app. That's it!

FIREBASE AUTHENTICATION

Knowing a user's identity allows an app to securely save user data in the cloud and provide a personalized experience across all of their devices.

Firebase Authentication provides backend services, easy-to-use SDKs, and ready-made UI libraries to authenticate users to your app. It supports authentication using passwords, phone numbers, popular federated identity providers like Google, Facebook etc.

Firebase Authentication integrates tightly with other Firebase services, and it leverages industry standards like OAuth 2.0 and OpenID Connect, so it can be easily integrated with your custom backend.

Key capabilities

FirebaseUI Auth

- Recommended way to add a complete sign-in system to your app.
- Provides a drop-in authentication solution that handles the UI flows for signing in users with email addresses and passwords, phone numbers, and with popular federated identity providers, including Google Sign-In and Facebook Login.
- Authentication component implements best practices for authentication on mobile devices and websites, which can maximize sign-in and sign-up conversion for your app. It also handles edge cases like account recovery and account linking that can be security sensitive and error-prone to handle correctly.
- FirebaseUI can be easily customized

*CODING MATTERS

*Facebook open sources Detectron

Available under an Apache 2.0 licence, you do need a machine that has a GPU, NVIDIA CUDA, for it to work.
<http://dgit.in/FBDTron>

*Open Media Alliance AV1 Is Better Than JPEG

Tests in a trial version of Firefox showing that the Alliance's AV1 video compression tech produces video files a third smaller than rival compression techniques.
