

Uber's secret tool - Ripley

Uber had a secret tool to lock down employee computers, laptops and phones remotely to prevent access from law enforcement. <http://digit.in/UbrRipley>

Spectre patch slows iPhone by 40%

Early benchmarks indicate that OS patch for the Spectre CPU bug may slow it down by about 40%. <http://digit.in/SpecSlw>

the path to a file, such as "images/mountains.png", to upload, download, or delete it.

- **Upload or Download** - Upload or download to native types in memory or on disk.
- **Secure your Files** - Use Firebase Security Rules for Cloud Storage to secure your files.

FIREBASE HOSTING

Firebase Hosting is production-grade web content hosting for developers. With Hosting, you can quickly and easily deploy web apps and static content to a global content-delivery network (CDN) with a single command on your end.

Features

- **Served over a secure connection** - The modern web is secure. Zero-configuration SSL is built into Firebase Hosting, so content is always delivered securely.
- **Fast content delivery** - Each file you upload is cached on SSDs at CDN edges around the world. No matter where your users are, the content is delivered fast.
- **Rapid deployment** - Using the Firebase CLI, you can get your app up and running in seconds. The command line tools present make it easy to add deployment targets into your build process.
- **One-click rollbacks** - Quick deployments are great but being able to undo mistakes is even better. Firebase Hosting provides full versioning and release management with one-click rollbacks.

How does it work?

Firebase Hosting is built for the modern web developer. Static sites are more powerful than ever with the rise of front-end JavaScript frameworks like Angular and static generator tools like Jekyll. Whether you are deploying a simple app landing page or a complex Progressive Web App, Hosting gives you the infrastructure, features, and tooling tailored to deploying and managing static websites.

Hosting gives your project a subdomain on the firebaseapp.com domain. Using the Firebase CLI, you can deploy files from local directories to your Hosting server. Files are served over an SSL connection from the closest edge server on the global CDN.

In addition to static content hosting, Firebase Hosting offers lightweight configuration options for you to be able to build sophisticated Progressive Web Apps. You can easily rewrite URLs for client-side routing or set up custom headers for your app.

Once you're ready to take a site to production, you can connect your own

development server, and deploy content for the same.

- **Set up a project directory** - Add files for your web app and add your static assets to your local Hosting folder. You can then test your site locally by running firebase serve.

```
// Points to the root reference
storageRef = storage.getReference();

// Points to "images"
imagesRef = storageRef.child("images");

// Points to "images/space.jpg"
// Note that you can use variables to create child values
String fileName = "space.jpg";
spaceRef = imagesRef.child(fileName);

// File path is "images/space.jpg"
String path = spaceRef.getPath();

// File name is "space.jpg"
String name = spaceRef.getName();

// Points to "images"
imagesRef = spaceRef.getParent();
```

Storage

```
// File or Blob
file = Uri.fromFile(new File("path/to/mountains.jpg"));

// Create the file metadata
metadata = new StorageMetadata.Builder()
    .setContentType("image/jpeg")
    .build();

// Upload file and metadata to the path "images/mountains.jpg"
uploadTask = storageRef.child("images/" + file.getLastPathSegment()).putFile(file, metadata);

// Listen for state changes, errors, and completion of the upload.
uploadTask.addOnProgressListener(new OnProgressListener<UploadTask.TaskSnapshot>() {
    @Override
    public void onProgress(UploadTask.TaskSnapshot taskSnapshot) {
        double progress = (100.0 * taskSnapshot.getBytesTransferred()) / taskSnapshot.getTotalByteSize();
        System.out.println("Upload is " + progress + "% done");
    }
}).addOnPausedListener(new OnPausedListener<UploadTask.TaskSnapshot>() {
    @Override
    public void onPaused(UploadTask.TaskSnapshot taskSnapshot) {
        System.out.println("Upload is paused");
    }
}).addOnFailureListener(new OnFailureListener() {
    @Override
    public void onFailure(@NonNull Exception exception) {
        // Handle unsuccessful uploads
    }
}).addOnSuccessListener(new OnSuccessListener<UploadTask.TaskSnapshot>() {
    @Override
```

Read file data

domain name to Firebase Hosting. We automatically provision an SSL certificate for your domain, so all your content is served securely.

How to implement?

- **Install the Firebase CLI** - The Firebase CLI makes it easy to set up a new Hosting project, run a local

- **Deploy your site** - When things are looking good, run **firebase deploy** to upload the latest snapshot to the servers. New versions are released all at once, so you'll never have to worry about half-finished deployments. But, if something does go wrong, you can roll back with one click any time.
