

### No winners for Lunar X Prize

Google-sponsored race for sending a rover to the moon has ended with no one taking the \$20 million prize. <http://digit.in/LunarNoPrize>

### China's AI chips

With the AI boom, Chinese chipmakers are exploring ways to make chips that'll add AI to any gadget. <http://digit.in/ChinaAIChips>

# Teardown: Apple iMac Pro

Looking inside the most expensive product from Apple

Abhijit Dey | [abhijit@digit.in](mailto:abhijit@digit.in)

## Same display panel

The 27-inch 5K display panel on the iMac Pro is the same one seen on the iMac 5K. However, you can't swap the LG Display model LM270QQ1 between the two models. You will have to go for the display panel for the iMac Pro since the webcam arrangement and cabling has been changed.

## Apple's custom T2 chip

Earlier, several components used to be discrete including the SMC (system management controller), ISP (image signal processor) for the camera, SSD controller, audio control, along with a Secure Enclave and a hardware encryption engine. All of these components have been bundled into the new T2 chip.

## CPU upgradability not confirmed

Being a Pro machine, only Intel Xeon processors are shipped. According to iFixit, it's still early to say whether a CPU upgrade is possible. Apparently, the chip looks like it was custom-built by Intel just for Apple.
