

Hooptie

Funding: \$32,997 or \$5,000 goal

Campaign link: <http://dgit.in/HooptieKck>

Hooptie aims to replace all your cleaning supplies with just one product. Aimed at cleaning cars, the creator of Hooptie claims that it'll work well with just about anything, from paint, to glass, leather, plastic and more.

The main goal is to cut costs when cleaning vehicles. Normally, you would need to pay to wax the car, then cleaning tires, glass, etc. Every aspect of your vehicle needs a different cleaning product. Or all you need is Hooptie and two micro-fiber towels.

Simply spray the surface you want to clean with Hooptie, use towel one to wipe-away filth, and then use towel two to polish. It sounds extremely easy, but we won't know if it actually IS that easy until we use it for ourselves.

Another aspect Hooptie aims to help with is the environment. Using Hooptie means you won't be using the gallons of water and soap you would normally use, which in turn won't be drained into the local stream/river/lake or the ocean. Some soaps are also known to contain phosphates which causes excess growth of algae that harms water quality.

Find Hooptie on Kickstarter. They're expected to start shipping sometime this April.

Magnic

Funding: \$109,298 of \$1,222,099 goal (converted from Euros)

Campaign link: <http://dgit.in/MagnicKck>

Magnic Microlights are non-contact brake shoe bike lights. How are they different from other brake lights? According to the creators, Magnic can deliver "never-ending bright light without any batteries, without wheel-contact, without cables, and without noticeable resistance". Phew, that's a lot to take in.

Magnic has a rather high crowdfunding goal that they're trying to meet at \$1,222,099. But the creators have stated that whether they make the goal or not, they will be going head with the product. The crowdfunding campaign is in place solely to offer more versions of the Magnic with more features.

The Magnic functions on eddy current technology and therefore doesn't need any magnets and will work with aluminium wheel rims, which is what most bicycles have.

Some of the additional features Magnic promises backers if they hit their goal is turn signals for the light, Bluetooth transmission and smartphone controlled navigation among others.

You can read more details about Magnic Microlights on Kickstarter.

Papier Machine

Funding: \$77,079 of \$54,994 goal (converted from Euros)

Campaign link: <http://dgit.in/PapierMchn>

While at a glance Papier Machine looks like any other book, it's much more than that. Once you open it, you will find that it looks more like an arts and crafts book than anything else, only, the primary ingredient is itself. You can cut, fold, and assemble the book as per the instructions provided in the book to create a set of paper toys.

But that's not what makes Papier Machine special, it's the fact that the book is printed with silver ink. Meaning you can actually build electronic circuits using Papier machine. Essentially, drawing lines connecting a power source and maybe an

LED bulb using the silver ink, will actually light up the LED bulb. Silver ink conducts electricity and with use of graphite pencils you can create real complete circuits.

This makes Papier Machine a great way to introduce kids to the basics of

electronics. Because, what better way to learn than while playing? Every toy you can create with Papier Machine is a new way to apply electronics, and a different game to play, be it mini-golf or a toy piano. You can find Vol. 0 of Papier Machine on Kickstarter.
