CYBERSECURITY is like fighting the Lernaean Hydra, every time you chop off a head, two new ones grow in its place. Cybercriminals are constantly evolving and refining their tactics. At the same time new devices continue to invade the market, and existing devices are getting smarter, increasing the opportunities for attacks. Botnets, which can be used for everything from cryptocurrency mining to DDoS attacks stand to become much more powerful. In 2018, expect some of the biggest cybercrime trends of 2017 to continue, including ransomware and smartphone malware. Cybercriminals will also find new and innovative ways to leverage distributed ledger technologies, machine learning algorithms, neural networks, and cloud computing. Expect a laser focus in targeted attacks, whether on individuals or organisations. With many kinds of cybercrime being sold on dark-net marketplaces, it will be possible for relative novices to compromise devices without even knowing how to hack.
