

SCIENCE IS THE PATH TO KNOWLEDGE, AND FINDING OUT ABOUT HOW OUR UNIVERSE WORKS. YOU CAN'T BE A GEEK AND NOT KNOW YOUR SCIENCE!

IT'S NOT ROCKET SCIENCE

THIS MONTH IN SCIENCE: Mysterious explosions in the Russian tundra, AI in healthcare, humanoid robots, antimatter, and a visitor from far away stars.

No aliens at Tabby's star

A sustained observation campaign of Tabby's star or the WTF star has found evidence that there is no alien megastructure in orbit around it. The dimming events experienced by the star is likely to be caused by a far more mundane explanation - dust. <http://dgit.in/wtfstar>

WHAT'S NEW

Researchers create videogame to explore workplace sexual harassment

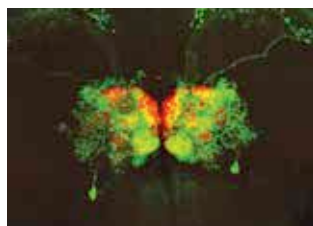

Researchers from MIT have come up with a game, called *Grayscale*, that lets players explore the various kinds of sexual harassment that occurs at a workplace. The gameplay takes place in the form of an email interface, where users have to respond to messages from various employees. Users have to respond to a wide range of scenarios, including an employee that touches another, a mail sent out to the entire office suggesting that yoga pants are inappropriate attire, and a woman having a tough time managing her newborn baby and her work commitments. As an HR professional, you have to deal with all these issues as and when

they arise. At the end of the short game, you will be given an appraisal of your performance. The best thing is you can play the game in office, and give the impression of actually working. <http://dgit.in/GryscI>

Researchers develop technology to create wiring diagrams for the brain

Neuroscientists have a pretty good understanding of what areas of the human brain are active when they are performing particular tasks, such as moving a leg or thinking of a response to a question. However, creating a complete map of how the neurons in the brain connect to each other is beyond the capa-

bilities of existing technologies. Researchers from Caltech have developed a method using fruit

flies, that makes the neurons colour up when they are active. The researchers can then directly observe the neurons firing through an electron microscope, and a hole in the heads of the flies. The approach allows the researchers to create a wiring map of the brains of the fruit flies. <http://dgit.in/mapbrain>

Tiny origami inspired robot

Researchers from harvard have developed a tiny robot, known as milliDelta with flexible actuators and high performance composite materials. The robot is strong and flexible enough to manipulate objects on a tiny scale, and has potential applications in manufacturing and medicine. <http://dgit.in/millidelta>

Nefertiti was no Pharaoh

The unusually beautiful features of a bust of Nefertiti compelled Egyptologists to come to the conclusion that she was a ruler of Egypt, however this was not possible as Nefertiti was not born in a royal family. However, her daughter was born into a royal family. <http://dgit.in/nfrtiti>

Raspberry Pi Supercomputer

Students at the Ohio State University did not want to use academic supercomputers to test code, and so created a supercomputer out of many Raspberry Pi circuit boards. Buckeye Pi has 128 circuit boards and 512 processors, and will be used for Earth science simulations. <http://dgit.in/2n1eHoN>
