

THIS IS TECHNOLOGY, CULTURE AND SCIENCE WITH A DIFFERENCE, AND THAT DIFFERENCE IS USUALLY ENOUGH TO MAKE MOST NORMAL PEOPLE GO "WTF?"

Geek-key

AI IN SCI-FI

When we do become a primarily space faring race, we'll need a couple of more planets to colonise. Thankfully, our space telescopes have found plenty of habitable exoplanets. Fancy colonising one of these?

Nike PlayStation sneakers

Nike and Sony have worked together with Paul George to create the PG-2 "PlayStation" sneakers. These might just be the nerdiest sneakers out there, every detail on the shoe points to its namesake in some way. And the sneakers' tongues – one with the PG (for Paul George) logo and the other with PlayStation – illuminate when you press them! So fancy!

WHAT'S NEW

The Pornhub year in review

The year isn't complete without Pornhub's annual Year in Review, where we take a look at the most searched terms in porn for the year of 2017. This year marks Pornhub's 5th 'Year in Review' lister and boy there's a lot of numbers and uhm, rather weird tastes. But who are we to judge!

Some of the more interesting numbers worth noting were the number of visitors to the site this year: around 28.5 billion! That's a whopping 81 million people per day.

Other than that, you had a total of 24.7 billion searches performed on the site this year. That's 50,000 searches per minute; 800 per second.

Among the top 5 most searched for terms, we had Rick and Morty sitting on number two and... Fidget Spinners on three.

Porn hub

There was a total of 3,732 PETABYTES of data transferred on the site. As mentioned on the site, "That's enough data to fill the memory of every iPhone currently in use around the world".

Barking Trains

According to Japan's transport ministry, last year around 613 animals were hit by trains. This caused commuters up to 30-minutes of delay on average, which in a country like Japan is apparently a big deal. Deer in particular take up a large percentage of the 613 animals. Deer are attracted to the iron fillings around the rail tracks. This because they need iron in their diets. The iron fillings created from the friction between the train and the tracks is a

convenient supplement for the deer. Unfortunately, it also means that many of them suffer a very gruesome fate.

Researchers from Japan's Railway Technical Research

Institute (RTRT) have come up with a rather strange new idea to scare the deer away from the train tracks. It entails having speakers installed on the train which plays the sound of a deer snorting soon followed by 20 seconds on dogs barking. This has been found to be effective in scaring the deer away from the tracks.

The RTRI is known for using some very strange methods to scare the deer away, but this one takes the cake.

Japan's crypto pop group

Kasotsuka Shoyo, which literally translates to Virtual Currency Girls are Japan's latest trending pop band. Each member represents one of the popular cryptocurrencies. They had their first concert this year and you had to pay in cryptocurrency to get it. <http://dgit.in/CrypPop>

Pet translator

Animal behaviour expert Con Slobodchikoff is one of the researchers trying to use AI to understand how dogs communicate. He hopes to use machine learning to help humans understand dogs. To this end he's working on an algorithm to help covert barks into English. Read more here: <http://dgit.in/wooftalk>

The Photobomber pro

This ad professional has found a great way to pass his time, and as a result, a really fun way for us to pass ours. He's inserted himself into random stock images to some great comedic effect. That's one great way to build your portfolio and get noticed. <http://dgit.in/photobpro>
