Hori Onyx

We've seen many third-party controllers for the PlayStation 4. Many of which were unofficial and unlicensed, and all of which have been wired. For the most part we've stuck to our wireless Sony PS4 controllers (Yes, we do have a PlayStation 4, how else are we supposed to prove the PC is better?). The Hori Onyx though, is the first officially licensed third-party wireless controller for the PlayStation 4.

One look at the Hori Onyx and you will notice that it resembles Microsoft's Xbox One controllers rather than Sony's classic DualShock controllers. From the stick layout, to the d-pad and even the overall shape of the controller; it's all very similar to the Xbox One's controller.

Like the DualShock 4, the updated Xbox One controllers have audio jacks present in them, but the Hori Onyx doesn't. There's also no lightbar on the back.

It's a good controller for those who are used to Xbox controllers but play on the PlayStation or are planning to make a switch. Heck, it doesn't

have to be a switch, maybe you just own both consoles and prefer the Xbox Controller. Either way, if you can look past the inconveniences the Hori Onyx a decent alternative.

Gas Pill

A team of Australian researchers have developed an ingestible electronic capsule which monitors gas levels in the human stomach. It even comes with its own mobile phone app and actually reports on gas conditions in your stomach in real time as it travels from your stomach to your colon. If you haven't figured out yet what exactly this pill does, it tracks farts.

But no, it's not meant to be a joke. The actual purpose of the capsule is to use its gas readings to get a better understanding of how our digestive system works and about the multitudes of microbes present in our gut. You can use these readings to better understand how food actually affects our body and what food may cause problems within our body. Collecting data of this kind has always been quite challenging, and there have been some very invasive methods that have been used in the past to do so. Until now. This is as simple as just popping a pill.

Looxid VR

Looxid Lab's LooxidVR system is a smartphone based VR headset. There are plenty of those in the market, what makes these stand out? It packs two eye-tracking cameras and six EEG brain wave sensors.

While there's no content out there right now that can actually make use of the data that this VR headset will provide, it has huge potential.

Imagine a game being able to modify its own difficulty based on readings from your brain, or watching a VR video that alters itself according to your brain.

However, Looxid's intention isn't for entertainment purposes, but rather for business and health. LooxidVR could potentially be a great tool for therapy. Especially for issues like high levels of stress and anxiety, or mental trauma and PTSD to name a few. Looxid showcased their VR headset at CES this year.
