

✉ I've read all your Fast Tracks from the year 2010. One thing I want to say is that most of the Fast Tracks contain very simple topics, which are available in any books related to that topic. I did not find any Fast Track which had very advanced information about the topic. Last time I bought Fast Track to Java, I found that there is nothing for me. It all contains very very basic information about all topics. Please do rectify. Also, another request – could you have a Fast Track on Networking Programming? Thanks.

Suresh Dubey

d Thanks for writing in. The philosophy behind Fast Tracks is that they are in fact meant to be basic. They're supposed to take someone who is curious about a particular topic, from a beginner to a decent level in the subject. However, we do come out with advanced Fast Tracks every now and then, in which case we label them that way. For example it could be Fast Track to Advanced Photoshop etc. As for the topic you have suggested, we will take it under consideration and add it to our idea repository.

Nash

✉ I have sent many emails to you before but this one is truly heartfelt, because it is the first time that I tasted success thanks to you guys. This week I had to give a small five minute speech on upcoming technology without any prior preparation. Your article on CES 2011 helped me and I got a big round of applause. Thank you Team Digit. Now I have been given the responsibility of creating a website for our school. So I want some tips on how to take inputs from web pages and store the same in a database. Please can you provide a Fast Track on Web Designing in the future? This month's Fast Track on .Net was so useful for me. Thank you again for your good work. Finally, I have a few suggestions for you.

1. Please also include software reviews beside your regular hardware reviews.
2. Please change the interface of your DVD in such a way so that the videos and trailers that you provide can play within the DVD interface and not in a media player.

Ayan Sarkar

d It's great to know we were able to help you out of a jam, but in the end it was your quick thinking that helped you. A Fast Track to Web Designing is something worth considering and we will surely discuss it at our next edit meeting. Your suggestions are also valid. Expect some more Software reviews in next month's issue of Digit. As for the DVD, you'll be surprised to know that we're working on it and this is one of the things that we're trying to incorporate.

✉ This is with reference to 'Why Indians Don't Buy Online?' article in the Feb 2011 issue of Digit. The author has rightly pointed out why online selling is not working in India. However, the author has missed one very crucial reason: Being cheated by the Vendors.

I have been purchasing online for quite some years now. And like all Indians, I like a good bargain. Though most of my purchases have been worth it, there have been a handful of cases where I felt I was cheated by the vendor. I find in India most online vendors are only interested in making a quick buck. Taking advantage of the fact that the customer cannot see the actual product, many times they show posters/photos

of good quality products, but send cheap Chinese or locally made low-quality duplicates. Quite a few times, the packages I've received have had neither an MRP nor the manufacturer's address. I've had a bad experience with a vendor on eBay.in, where he initially sent me a low quality product, which when I returned, he sent me a replacement which was of much better quality than the earlier item. My guess is that this vendor regularly sends products of cheap quality, and sends the actual high-quality product only when people complain/return the original product. And these would be very few as most people would not want to go through the hassle of re-packaging the product and couriering it back (at their own cost), especially if the product is not a very costly one. My wife keeps telling me to stop purchasing online, but I can't help myself, whenever I see a good bargain.

So nowadays I do not buy from sites like eBay, or Indiaplaza, where there are many different vendors under one roof, so to speak. I prefer buying from sites where the site is itself the vendor of the product. This way, I'm sure of the quality of the product, as the site owner's name, fame and reputation is at stake.
