You're being spied on!

At least five items on this desk could contain a bug that people could be spying on you with. We'll show you how easy it is for people to put you under surveillance

Nash David

We often find ourselves with a vast amount of junk: there's talk of our planet needing help on one hand and on the other we're busy consuming technology at a ridiculous pace. Over a period of time, we end up with more waste than we can deal with.

The problem

Most of us have used mobile phones for a few years now, and hardly any of us uses the same old mobile we started

off with. It's not like we've just thrown away the old phones, although some of us may have donated them to those less fortunate or the household help. Still there are chances that most of us have an old phone lying about collecting dust!

The easy way

We pooled our junk together, and found that we had a few phones at hand. Some were fully-functional, some needed new batteries, and some were just scrap that could only be used to cannibalise parts for other phones. We're going to keep working on inventive ways in which to use your old phones in subsequent issues. However,

based on our experiences at exhibitions and from the letters we get, it's obvious that one of the most popular new toys is an audio spying device based on a phone. What this device does is use a SIM card and a mobile network to allow you to connect to it silently, and listen in on the sounds of the surroundings. Now, almost any phone made in the last 5 years should allow you to do this just by tweaking some settings, the problem is that the darn gadget still looks like a phone – and a phone is not something you're used to seeing lying about in the open. So the obvious thing to do is to find a way to conceal that it's a phone.
