Digit's Computex coverage

This is just the tip of the iceberg. Check out our full coverage on http://www.thinkdigit.com/latest/computex_2011.html

Geekgasm at Computex 2011

Digit went to Computex this year and came back with some of the latest technology news, component announcements and emerging trends. Read on to find out what went down in Taipei...

Team Digit

readersletters@thinkdigit.com

Of the three big technology trade shows - CeBit, CES and Computex - the Taipei monstrosity that is Computex is perhaps the one that is most eagerly awaited by hardcore geeks. The reason is that Computex is all about computing; in essence you have the latest, fastest, flashiest and geekiest computer components on earth, under one roof, vying for your attention. Well, two roofs to be precise since Computex is so huge it requires two venues. Chew on these facts and figures to imagine the scale of what we experienced this year:

- 5 Days
- 125,000 attendees
- 1,800 exhibitors
- 5,300 booths
- Big names like ASUS, Gigabyte, ECS, Intel, AMD, NVIDIA and Microsoft
- 10,000-plus hardware ICT products

The biggies display their wares

ASUS kicked off the party in style with one of the biggest announcements before Computex officially even began -

Bird's eye view of the Exhibition Floor

that of the Padfone. The ASUS Padfone is a device that explores one possible convergence between two popular mobile devices — the smartphone and the tablet. The Padfone solves the problem of data transfer hassles and multiple SIM cards / data plans when both a smartphone and 3G tablet are used. With the Padfone, the smartphone docks inside the tablet to give users an expanded view to suit their tasks. In effect, it's little more than a docking station in the

shape of a tablet, but hey, as far as announcements go, a good way to begin Computex.

We also saw the ASUS WAVI Xtion in action. It's a multi-component technology that brings motion control to the PC. ASUS has been working closely with PrimeSense in creating the core technology behind WAVI Xtion and the product also brings to the market a host of additional pioneering highlights. For instance collaboration with AppSide has resulted in the creation of Xtion Portal, and ASUS has also worked with Hillcrest on the highly-interactive Xtion Browser. The bundled game DanceWall, which gets consumers physically active as they enjoy themselves with family and friends, was developed by Softkinetic Studios.

ASUS announced a whole range of products in its Republic of Gamers series. The first among these is the new ROG G74Sx 3D gaming laptop, with a choice of quad-core Core-i5 and i7 Sandy Bridge processors, and the just-released Nvidia GTX 560M dedicated GPU.

The ROG CG8565 Gaming System desktop has a stealth fighter-inspired case, and comes with a 'Level Up' button on the chassis, to provide an "instant real-time speed boost." It features a choice of Sandy Bridge Core i7 processors, and comes with a Z68 motherboard, a GeForce GTX 590 for a GPU, and a ASUS Xonar for a sound card.

As for motherboards we saw the new ROG Crosshair V Formula motherboard (in markets now) that is based on the AMD 990FX chipset for the AM3+ socket, and comes with a graphical UEFI BIOS. It's the first ROG motherboard with AM3+ CPU support and
