

AIX on Power™ works 99.99% of the time. 100% of the time.

At 99.99%, IBM's UNIX platform, AIX on Power™ Systems, has the highest uptime in its class. The remaining 0.01% leads to an unplanned downtime of only 15 minutes a year – which is 2.36 times lower than our closest UNIX-based competitor. AIX's 99.99% uptime holds good for all sizes of workloads. Which makes it perfect for any company with growth on its mind, 100% of the time. So, think UNIX, think AIX.

Smarter computing for a smarter planet.

UNPLANNED DOWNTIME comparison based on ITIC 2009 Global Server Hardware and Server OS Reliability Survey as of July 2009 which polled IT managers at 400 corporations from 20 countries worldwide to quantify and qualify the reliability of 15 different server operating system platforms running on a variety of proprietary UNIX and Intel-based hardware platforms. As far as IT departments are concerned, anything that causes them to take the server offline, regardless of the cause, is unplanned downtime. Included in this category are instances of vendors releasing an unanticipated patch to fix a technical bug or security vulnerability. The results indicate that the IBM AIX on the Power series System p5 and System p6 servers is the clear winner; it offers rock solid reliability, besting all competing operating systems, including those running on Intel-based x86 machines. The IBM servers running AIX consistently score at least 99.99% uptime or just 15 minutes of unplanned downtime per server, per annum.
