

VIRTUALDUB

VirtualDub is a very simple, yet powerful video processing utility. Though it doesn't have the features of a full-fledged editing software such as Premiere Pro, it does provide the basic functionality for editing and splicing video files. Basic, repetitive tasks such as resizing can easily be handled by VirtualDub. It's also extremely easy to batch edit multiple video files.

Getting started

The basic VirtualDub interface is very simple. You can drag and drop to open a video file for editing. On doing that, you'll see two panes – one of the original video and another is the preview pane. If your PC is powerful enough, you'll be able to see the preview being generated in real time.

Basic requirement – codecs

As VirtualDub is primarily meant for editing AVI files, there are some essential codecs and software required that you'll need to edit MP4, MKV, MOV files, etc. The K-Lite codec pack, available at <http://bit.ly/oG5LEH> should be sufficient for most of your codec needs. While installing, make sure that you set file associations for "Win-

an MP4 video located at C:\Music\Videos\RandomVideo.mp4, you must create an AVS file. Open notepad and in the input field type DirectShowSource (C:\Music\Videos\RandomVideo.mp4). Save the file as FileName.avs and then open it in VirtualDub. Your MP4 file should now be available for editing. Bear in mind that your output file will still be an AVI file.

Use filters

An essential feature of VirtualDub is essentially a collection of presets similar to the

filters can be added at once by clicking on the "add" button and the video can be processed as specified. All the effects you

apply can be previewed directly in the main window itself. Head here for more filters: <http://bit.ly/qn0ts2>.

Apply logos

Filters such as the logo filter can be used to add your own watermark to a video. This is useful in situations where you would want to upload a video to YouTube and such. To insert logos, hit [Ctrl] + F to open "Filters" and select "logos". In the new window that pops up, browse to your logo file, (any image file adjusted to the size you require) and click Ok. There are buttons at the bottom

labelled BR, BC, etc. which stand for bottom right, bottom centre and so on. These are used to position the logo. You can fine-tune the placement by adjusting the X and Y offset as well. The opacity of the logo is adjusted by moving the opacity slider or typing in the percentage opacity.

Adjust video playback speed

Sometimes, you may want to add slow motion effects or speed up a video. To do this in VirtualDub, load your video and hit [Ctrl] + R or just select Frame Rate in the Video menu. Note the current frame-rate at the "No Change" radio button and select the "Change frame-rate to (fps)" and insert a frame-rate which you require. To double the speed of the video, enter a value which is double the default value. To halve the speed, enter a value
