It may only be a matter of months before babies start getting treated for deficiencies while in their mother's womb <http://bit.ly/pojxkN>

Acer Iconia A501

The future is bright, the future has an OS update lined up!

The Acer Iconia A501 weighs exactly the same as the Motorola Xoom—730 grams (approx.), but just feels more comfortable to hold and use for a long duration. The build quality is quite good. No rough edges.

The dual core 1GHz processor deservedly gets 1GB of RAM, allowing it to flex its muscles. The performance on offer is quite good. The moment games kick in you do feel the punch. Even with a couple of apps and the web browser open in the background, the HD version of Need For Speed-Shift didn't face any problems.

The white levels are quite good on the 10.1-inch display, and that shows when browsing the web. The crispness also helps

when you are reading text. The extremely reflective nature of the display does mean you will be forced to use it at certain angles, depending on the light positioning.

It's a problem playing back most HD video files though—unrecognized codecs. The Standard Definition AVI files played back just fine. Once the Android 3.1 and 3.2 updates arrive on this device, this problem will be solved.

The placement of the camera on the rear side is a bit of an issue though. If you hold the tablet in landscape mode, your fingers will inevitably touch its camera.

Battery life on the Iconia isn't as good as what we see on the

Apple iPad, but definitely better than what we experienced on the Motorola Xoom. This one lasts about three days, from full charge to full discharge, which is quite good.

In a straight comparison to the Motorola Xoom, the Iconia A501 has the advantage of form factor. Check out our detailed review here: <http://goo.gl/vpsFA>

Beetel MAGIQ

Different, very

The MAGIQ has a 7-inch resistive touchscreen, and comes preloaded with Android 2.2.2.

There is a neat UI skin wrapped around the OS, and we kind of like the multiple desktop thing that it is trying to create here. The traditional Android notification bar has been removed, and what remain are just the icons - for bat-

tery status, wireless control, network signal, Bluetooth and even brightness management.

The MAGIQ is powered by a 1GHz processor and paired with 512MB of RAM. The tablet comes with 8GB of built-in storage, and you can expand the memory using a microSD card, up to 16GB. The limited amount of RAM is going to be a bit of a performance-limiting factor.

The 7-inch resistive touchscreen is a definite sore point. Resistive displays are just a backward step for the product as a whole. Capacitive screens rock!

The 2MP camera on the rear, as well as the video chat one, isn't very good. Extremely grainy images at best, even with good lighting around. Videos are very jerky as well.

Battery life is not as good as we hoped it would be. A bit of video viewing, web browsing and some music and the MAGIQ ran out of battery in about 4 hours. This was when the brightness was turned down to 20%.

To sport a price tag of ₹9999, the MAGIQ does make some compromises - resistive touchscreen, Android 2.2 and a heavy form factor. However, if you don't mind spending ₹13000 on a network locked tablet, then the Reliance 3G Tab is attractive.
