

>>“It’s better for developers to use the web as a platform”>>

>>**Håkon Wium Lie**, CTO, Opera Software, on CSS, and how it’s changing the way we consume content online!

>> **CSS3 is being developed in a modular fashion. What are some of the new features being recommended in CSS3?**

Yes, development in CSS3 is now modular. Currently, there are around 20 to 30 modules. Border radius in CSS is one of the core mature functions. Using CSS transitions, we can create simple animations, by, writing few lines of code. This would otherwise take a lot

of effort in JavaScript or Flash. This is much simpler to do, and is also supported across the board. Besides, Flash wouldn’t have worked on all devices anyway, right? But these kind of things will work across all devices very soon.

>> **If future additions to CSS will be via modules, will there ever be a CSS4?**

Right, CSS3 is very different from the CSS 2

and CSS 1 specs. They were single specifications. CSS3 being modular, it makes it hard to answer the question, when will CSS3 be done, because it will, never, really be done. Also with time, some of the stuff, like rounded borders, may be people would want to do more complex stuff with rounded borders. May be for that, there could be a CSS4.

>> **CSS is now being used even outside of web applications, for example in GTK+. What are your thoughts on that?**

Well, in order to make something a programming platform, you need a programming language as well, and CSS is not a programming language. You have a programming language for the web and it’s called JavaScript. And along with HTML and CSS, those three are really the foundation of the web. That’s what those who want to write web content will have to deal with.
