

Vodafone Relocation Service

Vodafone's relocation service will allow post-paid customers to get a new local number without changing tariff plan and credit limit <http://dgit.in/JqJ9Qz>

Google Drive to offer 5GB

Google has finally got onto online storage offering users 5 GB of storage, in direct competition to Dropbox <http://goo.gl/AuP5I>

Build your own website: From novice to expert

We show you how to put up a website for almost any scenario

Nishith Rastogi

Admit it, at some point or the other while visiting the number of websites online, you have wondered about having your own web presence. But Web-Design, HTML, the plethora of options available just muddled your resolve. Fret not, in this workshop we cover how to build your web-presence from scratch without expecting you to be a code ninja.

We'll begin with covering simpler options and ready to deploy solutions and then we will move on to setting up your own cloud hosted web server for those who have a need for speed.

So the quickest way to get on to the information superhighway is via a blog. Wordpress and Tumblr are two popular options available; both provide free hosting, free sub-domains, you can also map them to a custom domain name, and wordpress can even be installed on your own server (which we will cover later in this article).

You can start by visiting <https://en.wordpress.com/signup/>. Here you can choose if you want a custom domain for a price instead of sub-domain which will give something like yourname.wordpress.com

To begin choose the ad-supported free hosting, where the wordpress.com will manage the server, bandwidth and hosting for you for free. If you think you require more customisation and zero ads you can choose the paid hosting plan. Wordpress provides you with other host options if you want to do it yourself.

Wordpress can be customized in aesthetics with the use of themes and skins,

there is a large collection of them available which gives you a variety of options in form and factor. No of panels, horizontal scroll; you have got them all, there are free options, and if you fancy there are plenty of advanced paid themes also available. The power and flexibility of Wordpress comes in the forms of plugins for various functions. Much like App store downloads for iPhone. If you want to detect spam in your comments, there is a plugin for that. If you want to enable Facebook comments, there is plugin for that, worried about tag cloud, well you got that one too.

Tumblr is widely regarded as the fastest growing blogging platform but it's more than just blogging. Consider it as

Use this to get a more professional looking URL

an online web storage of everything that interest you, and is publically sharable. You can choose to post a piece of original text, quote someone, post images, video, audio, chat conversation or simply a link to something. It has the usability of twitter (including following people) with the flexibility of Facebook in what you want to post, making it an ideal first landing spot on the web for beginners.

Unlike WordPress, Tumblr doesn't provide an absolutely simple way of using a custom domain name (say <http://www.YourChoiceOfURL.com>) but it can be accomplished via the following two step process none the less as described in the official tumblr blog.

As a first step, you should buy a domain (refer to the next section). After that if you are using a subdomain like blog.mywebsite.com, follow the registrar's instructions to point the CNAME record for the subdomain to domains.tumblr.com OR If you are using a domain that has only two levels, like mywebsite.com (which is most probably your case) follow the registrar's instructions to point the domain's A-record (IP address) to 66.6.44.4.

Another thing to note would be that you don't need to do anything with your nameservers and allow up to 48 hours for the changes to take effect. Once you are done with the above log in to Tumblr, click the name of your blog at the top of the Dashboard and click Blog Settings. Check the "Use a custom domain name" box and enter your subdomain (ie. blog.mywebsite.com) or domain (ie. mywebsite.com). Click the "Test your domain" button. If the test finds any problems, correct them. Keep fixing problems and clicking the "Test your domain" button until the test is successful. Then, click the "Save" button at the bottom of the page. You're all done!

Buying your own Domain

After a point you would like to own a custom domain name (like yourname.com) instead of using a subdomain (like your_name.some_website.com), the motivation to do this could be because it looks more professional, is shorter and easier to remember, is slightly more credible or simply because it is cooler and you want one, and if that is the case then who are we to argue.

To accomplish this you can do it with any of the hundreds if not thousands of Domain Name registrars. We will be covering three options, "name.com", "BigRock.in" and the 'Google Apps for Domains' way. name.com is chosen because in our experience it is fast,
