Google confirms Project Glass, shows off heads up display AR glasses

Google has officially unveiled what has been rumoured for the past couple of months – heads up display

The geek shall inherit the earth

glasses that will give the user augmented reality features and allow for direct interaction with

paired Android devices. At this stage however, Google's augmented reality glasses remain a concept, and no working models have been shown off.

Being developed at Google X Labs as Project Glass, Google's augmented reality glasses are expected to cost as much as a smartphone, roughly between \$250 and \$600. Apart from pictures depicting what a working model will look like (glasses with just one lens covered by the heads up display mechanism), Google has also released a video, which shows a young man interacting with his Android phone via his Google HUD glasses – making video calls, checking reminders, replying to messages, getting directions overlaid, using voice search, taking photos, etc. [d](#)

Apple iPad mini to arrive later this year

The latest rumours out of the mill indicate that the once expected iPad mini may actually be launched in 2012, finally putting to rest Steve Jobs' famous prediction that any tablet less than 9.7-inches is just too small.

According to Chinese site, Netease, Apple has placed orders for roughly six million

7.85-inch iPad mini tablets. Apple apparently will ship them by the end of the year, or even in the third quarter, managing to meet Windows 8 and Google's budget tablet competition at the same time. The 7.85-inch iPad mini is expected to sell for roughly \$249 to \$299.

Software developers will be tearing their hair out in frustration, unless of course they've already adapted to the likes of the Kindle Fire. [d](#)

Olympus' flagship micro four-thirds camera

Olympus launched its flagship micro four-thirds camera – the OM-D E-M5, which design-wise is reminiscent of retro film cameras and the older OM series of film cameras. It comes with a 16.1MP Live MOS sensor and a dedicated electronic viewfinder with a 1.44M-dot LCD, 100 per cent field-of-view coverage and around 1.15x magnification.

Other features include 5-axis image stabilisation, dust and splash-proof construction, 9 FPS high-speed shooting, a 3-inch tilting OLED touch-

screen and a bundled M Zuiko 12-50mm lens. The Olympus OM-D E-M5 will set you back by ₹66,990 if you plan to only get the body. With the 12-50mm lens, the cost goes up to ₹77,990. You also get an 8GB Class 10 SD card free with the camera. [d](#)

Intel lures kids with the Studybook

Yet another entrant in the education-centric tablet category (This space is getting crowded, isn't it?). Intel aims to tap the elementary education market, with the Studybook – a 7-inch slate powered by Intel Atom Z650 processor. Part of Intel's Learning Series, which also features ultrabooks and notebooks, the Studybook tablet can be made to work with on Microsoft Windows 7 or Google's Android Honeycomb platform. The tablet is the third product in Intel's line of low-power computing devices for the education market.

Intel's Studybook tablet comes with optional 0.3MP front-facing and 2MP rear cameras. Other optional features of

Studybook are an accelerometer, light sensor, 3G, Bluetooth (all models support Wi-Fi) and a mini-High-Definition Multimedia Interface (mini-HDMI) SIM card slot for 3G connectivity. Intel says its Studybook slate is drop-tested for a little over 2 feet, is water and dust-resistant and is suitable for kids as it weighs 1.2 pounds and measures 8.12x5.31x0.65-inches.

Intel's Studybook has a wide range of educational content, including an optimised e-reader that allows students to easily read text on the device, and a LabCam, which incorporates the Studybook's camera into a potential science lesson.

Loading and switching among apps is quick, and the audio quality is fine and clear, though a bit tinny. [d](#)
