

HTC One X update

HTC has started rolling out an update for the One X, fixing battery life, unstable Sense UI, overheating, and other issues. <http://dgit.in/I4qhqv>

TRAI's 'per second' plans

TRAI's mandated operators to offer at least one tariff plan based on per second pulse rate, for both pre-paid and post-paid. <http://dgit.in/I4qFoY>

Apple releases Flashback malware removal tool with Java security update

Apple has released an automated removal tool to help users remove the Flashback malware discovered by Dr. Web in April. It had infected an estimated half a million computers worldwide within a couple of weeks.

The Flashback malware is a Trojan that has been designed to exploit a vulnerability in Java, allowing it to steal user information through the web browser and other applications, and flash it back to remote servers. It has many variants, some that mask themselves as Adobe Flash video and other browser plug-ins that users mistakenly agree to install, and some that can even auto-install without direct user interaction.

Other companies released their own removal tools for the virus, starting with Kaspersky and F-Secure, and then Symantec, a little ahead of Apple – which had announced it would be developing one, two days prior to Symantec's tool release. Apple's tool will be part of a security update to Java. The fruity giant says the Flashback removal tool will get at the "the most common variants" of the malware, and also block automatic web page Java applet execution. The Apple Flashback removal tool is only available for systems

running OS X 10.6 or later, and will be bundled with the latest Java runtime, that also contains its own patches. The tool will install MRTAgent and a command line tool, which scour and find any Flashback malware

Apple no longer safe from trojans

instances, submit a log to Apple and then delete themselves. While all currently known Flashback variants should be successfully removed by the Apple tool, it will require regular updates to work effectively. Apple will also be working with internet service providers to try and disable access to the remote servers that the Trojan malware is co-ordinating with. Experts are predicting the time of "no malware for Mac" is at an end, with the bad guys or malware authors turning their sights to the platform, deftly using their experience with the Windows and Linux malware. You can download the removal tools with Java for OS X Lion 1212-003 or Java for Mac OS X 10.6 Update 8 packages. [d](#)

China-based hackers target India

Hacker group Luckycat carried out a spate of cyber attacks on the web sites of the Indian government and Tibetan activists, reveals a report by IT security firm Trend Micro. The report further reveals that these attacks were part of an organised effort and attackers succeeded in compromising 233 computers. The Luckycat cyber campaign, is being linked with 90 cyber attacks in recent past that targeted the Indian, Japanese and Tibetan activists.

Baburaj Varma, Head - Technical Services (India & SAARC) Trend Micro says that the attacks have been traced back to hackers based in China. One of the group's members was found to be a Chinese university student. He further said that the attackers targeted a number of Japanese and Indian industrial sites working in aerospace, enginery, engineering,

shipping and military research. Chinese government involvement hasn't been ruled out since Tibetan activists were targeted.

According to reports, the computers were attacked with malware by prompting email recipients to open attachments. The attacks were said to be "extremely successful" and aimed at monitoring the targeted sites. The attackers behind the Luckycat campaign were given infrastructure to organise other attacks including the ShadowNet campaign.

Government web sites continue to be targeted by cyber attackers. Union Minister, Sachin Pilot recently revealed as many as 112 government web sites, including those of Planning Commission, the Finance Ministry and various State Government agencies, were hit by cyber attacks during a three-month period ending February 2012. TRAI cracks down on spammers; asks for per second plan

The Telecom Regulatory Authority of India (TRAI) has reportedly disconnected 26,769 subscribers and issued notices to 36,156 subscribers for sending promotional SMSes and making unsolicited calls. The regulator further said it had penalised 94 telemarketers and blacklisted four other telemarketers for violating its SMS Spam regulations, which came into force on September 27, 2011.

In other news, the regulatory authority has also asked all service providers to provide at least one tariff plan of one paisa per second (for local and national long distance calls) in addition to other plans for both, postpaid and prepaid subscribers. This, however, doesn't come as a cause of concern for leading telcos since they already offer such an option.

The regulator continues to maintain its stand on the existing cap of 25 tariff plans that can be offered by service providers. [d](#)
