Facebook's feature phone app, available for Java-enabled phones, now supports Hindi and seven other Indian languages. <http://dgit.in/Ij5sFx>

5 COOL WAYS TO USE YOUR GPS-ENABLED SMARTPHONE!

Go beyond making calls! Transform your smartphone into your fitness trainer, restaurant hunter, geo tagger and personal tracking device!

Sameer Mitha

You've just picked up a brand new smartphone/tablet and want to make the most of GPS-enabled services and apps on it. This device could be an Android smartphone/tablet, iPad, iPhone or any other device that has GPS enabled on it. Essentially, when an app says that it would like to use your location, it will use the mobile network, Wi-Fi or the onboard GPS (Global Positioning System) to identify your location. But to pin-point your accurate location, you need to activate GPS on your device first.

There are a number of apps and activities that a user can take advantage of with a GPS-enabled smartphone. Monitor where children (yours hopefully) are, find the nearest restaurant or prove that the tower of London isn't behind you in that picture courtesy Photoshop.

GPS-enabled apps also help perk up your social life. Seriously. You can find which pubs your friends are in, know what movie they're planning to watch and even which restaurant they went to last night.

Spy on...um, we mean track your buddies

Say you want to keep an eye on grandpa so you know where he's at any given moment during the day or you want to know if the kids are going to school

everyday. Well, thankfully it's possible to track the movement of your loved one if both you and they have GPS enabled.

The simplest way to track the location of your friends and family is through Google Latitude. Adding someone to Latitude is as simple as sending them an invitation and voila! Your location can now be shared with friends and family.

Google Latitude can be accessed not only from your smartphone or tablet, but from your computer as well. On either device, all you need to do is log on to Google.com/latitude. To run Google Latitude, GPS isn't a criteria but it helps pin-point the exact location. All the device needs to be capable of is Google Maps. Latitude works with any device, be it an Android, iPhone, BlackBerry, Windows Mobile 5.0+ or Symbian.

There are many other apps that can help users share their locations with friends and family. Some such apps are Foursquare, Glympse and echoecho. These three apps are available for free on Android, iOS, BlackBerry, Windows Phone and Symbian.

Make your relatives jealous

Geotagging is the ability to add the exact location where the photo was clicked. This nifty little feature has seriously taken the world by storm. Online photo sharing and social networks have added this ability, ensuring the location at which the photo was taken is appropriately represented. If you take pictures with your smartphone

rather than a point-and-shoot (although many point-and-shoots today have an in-built GPS for geotagging), you can tag the location at which the picture was clicked. Almost all smartphones ask for access to your location to automatically geotag the images you click with the device. If you're an iPhoto user, you know the benefits of geotagging as you can take advantage of the Places feature of the software. Your photos are presented on a map with red pins where you've either assigned a

Geotags help organise your pics by location

place or taken photos with an iPhone. If however you'd still prefer to use a point-and-shoot, there's a way to use the GPS from your smartphone to geotag the images you've taken on your camera.
