Lumia 900 software bug

Nokia confirmed a Lumia 900 software bug affecting data connectivity
<http://dgit.in/JqJaEb>

One popular app available on iOS and Android that will help you geotag your location on photos is Geotag Photos Lite (free). The Pro version will cost you ₹201 on the Google Play Store and \$3.99 (₹205 approx.) on Apple's App Store. A great feature of the app is that it allows you to use your smartphone's in-built GPS to store the location data, and add it to photos taken with your digital camera later. The catch is that the clocks on your smartphone and camera need to be in sync. The photos can be automatically geotagged by matching the time at which they were taken.

Take your date to an exotic place for a change

So you've decided to go on vacation with your beau to a new city. But you really don't know the best local joints to hang out at or spots to experiment with that exquisite cuisine you'd heard so much about. Fear not, your smartphone comes to your rescue! There are a smorgasbord of apps that will give you details of places you can visit in your proximity. Three apps that are really useful here are Foursquare, Zomato and Burrrp available for free on the iOS App Store and the BlackBerry App World. Zomato and Foursquare are available for free on the Google Play Store and the Windows Phone Marketplace as well.

All the apps use your location to give you the best options closest to you. Zomato only gives you the option of dining out, food home delivery and the nightlife in the city, where as Foursquare and Burrrp give you a wider range of activities to choose from such as food, nightlife, shops, art, outdoor, events, movies and more.

These apps not only provide you with details of the restaurant/event but also give you access to the menus and user ratings. It's very simple to navigate through these apps and find a place best suited to your needs. If you're worried about how to get to your chosen destination in the new city, don't worry. All these apps will show you the location of your destination on Google Maps and provide you with directions as well. Don't feel like the new kid in the city now, do ya?

Dope out the best way to get home or anywhere

Obviously, the first thing that comes to mind when someone says GPS is "maps". Yes, this is by far the most used feature by any smartphone user who uses GPS. It's true that the maps aren't always accurate, especially in a country like India and they aren't the best at giving the most accurate directions but they get the job done for getting users from point A to point B. This is especially useful if you're in an unknown city and the locals are doing a pathetic job of helping you with directions.

Find the best way to get home

For iOS and Android users, Google Maps comes in-built on the device. We recommend updating the app as and when you see an update available, as this will drastically improve the results you get. Windows Phone devices come preloaded with Bing maps.

Even though the maps and features on smartphones aren't as elaborate as the ones found on dedicated GPS devices, they get the job done nonetheless.

You can type anything in the directions option of the app – be it the name of a mall or a street or even a restaurant – if the location is popular, it will pop up on the maps. Just don't expect the route to be the fastest or the shortest, especially in India.

Give Taylor Lautner a run for his money

You can use the GPS on your smartphone to keep fit, especially if you're a runner. There are apps that map the route you've taken, the distance you've run, your speed, calories burned and so on and so forth.

A variety of apps available on the Google Play Store and the Apple App Store will satisfy the runner in you.

But one app that really caught our attention is the Run Keeper Pro. The app actively tracks your distance covered,

Keep your body in tip-top shape

how much time you took and the route – all in real time. The app stores all your data and you can view it anytime by logging on to runkeeper.com. You can also geotag photos clicked during the run and share all the data captured by the app via email or social networks.

Serious runners will truly appreciate some features of the app. The app indicates if you're ahead or behind your target pace so you know if you need to speed up or slow down. There's also an in-built heart rate monitor but you'll need separate equipment to take advantage of this feature. The best part about this app is that it's absolutely free.
