How the iPad cover works

Peek-a-boo, I see you

A close look at how the iPad smart cover works

Flipping open the Smart Cover even slightly wakes the device up

Sameer Mitha
readersletters@thinkdigit.com

So you just picked up a brand new iPad (second or third generation) and decided to add a Smart Cover to the mix. If you thought it was magic that made the device go on and off every time you open/closed the cover you're in for one major shocker!

The Smart Cover – available in leather and polyurethane variants – looks really thin and feels really nice in your hands.

The portion of the cover that touches the screen has microfibers that help protect the screen from dust and scratches. The cover folds and doubles up as a stand that holds the iPad upright. The smart cover also folds up into a stand that tilts the iPad at an angle enabling ease of typing. If you like to hold the iPad, the smart cover can flip back the same way in which you would fold a magazine. If you want to use the rear-facing camera of the iPad, the smart cover can be folded in half to

expose the camera for use. You really don't need to separate the smart cover from the device as you would with other third-party covers.

If you thought these reasons are enough to call the smart cover “smart” think again. It also wakes up and puts the

You have 10 different colours to choose from

device to sleep when opened and closed. The technology behind the smart cover can be summarised in one word – magnets. There are an astonishing 21 magnets in the smart cover and 10 long slim

magnet strips in the iPad. The long magnets on the iPad hold the smart cover on the device firmly, with the cover's magnets clipping to the left side of the iPad. Since the right side of the cover doesn't have any hooks, it sticks to the screen thanks to the magnets in the device and the cover.

What the right side of the device does have is a sleep/wake sensor. This sensor interacts with the magnets when the smart cover is put or removed.

As mentioned earlier, the cover also folds and doubles up as a stand. Four of

Also turns into a good stand for better typing/movie viewing experience

the strips on the front of the cover fold up to make the stand. On the rightmost strip of one of these strips, there are 15 magnets that stick to a steel plate. This rests in the leftmost strip to form the triangular shape

used to create a stand. This ensures that the bond is strong when the cover is folded and supports the weight of the iPad.

Natively, the first generation iPad isn't compatible with the smart covers as the idea of the covers was conceived with the iPad 2. As for the third generation iPad, the iPad 2 sleep/wake sensor isn't polarity specific whereas the new iPad is. This means that for some, your old smart cover may not work. It seems Apple rectified this issue with some of the later launched smart covers (making them polar specific). These covers work on the iPad 2 as well as the new iPad. If you're wondering whether your smart cover works on the third gen iPad, we'd say take it to an Apple store near you and give it a try to find out!
