

Zero1 Awards Distribution

Team Digit goes on a road trip to congratulate winners of our Zero1 Awards story of 2011

LED monitors compared

We compare over 20 monitors from a variety of vendors to tell you the best one for your needs

A little dollop of reassurance when driving down an unknown road

**FIND
YOUR WAY**

Vishal Mathur
readersletters@thinkdigit.com

It is true that we all get lost sometimes, trying to find our way to a destination we have never been before. Some drive on for hours even if it is in circles. Some just roll down the window and ask the nearest pedestrian or passers by. Mostly, you will find the destination, but with a bit of riff raff along the way.

The alternative is a Personal Navigation Device (PND), which combines a GPS and Voice Navigation into one tiny device.

IT'S A GUIDE

Ideally, these devices are meant for use as a guide, and not as a hard and fast rule to go exactly where they are suggesting. If

you are ever relying on the navigator to get you through paths unknown, keep your eyes peeled on the road, and all the possible drivers' senses activated. The reason why a GPS device may lead you into trouble are because of two reasons. Either the map for that region is outdated or mapping errors.

RISE OF PND

Over the years, the PND as a device has grown within its primary role as a navigator. Map quality, primarily, has improved massively. Case in point being the introduction of 3D maps on most devices. You can also customize how the map looks on your device - points of interest (POI), street names, etc. In addition to that, most devices allow

you to change the voice of navigation. Not only limited to male and female, but also to local languages if supported on the device. Traffic updates as well as speed trap guides are some additional features that navigation devices are deploying globally, but they aren't available here.

BUILD QUALITY

Devices up to ₹12,999

The PNDs have a relatively similar look - the same display with a clean bezel, most hardware keys and ports on the side panels and a clean back to enable the attachment of the windshield mount. Let us start off the most inexpensive navigator in this comparison, the SatGuide 4.3 Navi with Entertainment. The combination of black and silver around the bezel looks

very classy. Most of the ports are on the left side spine - 3.5mm, microSD slot, and the Mini USB port. Flip the device over, and a black finish that has a tad bit of self-imprint on it will greet you. The speaker is clearly visible on the bottom left. It takes considerable effort to take out the stylus, since the chamber seems a little too snugly fit for it. This navigator seems well-put together and definitely looks more expensive than it is.

From the same family - the SatGuideNavi 5.0 with Video, you get design elements and finish very similar to the one in the smaller sized sibling. Except there is more of it in this case! However, the Navi 5.0's build quality is certainly a notch above the sibling, and no wonder considering the
