

higher price tag. The Navi 5.0 has done very well in our design and build quality ratings, and is neck and neck with the MapmyIndia VX140, which is ₹1,000 more expensive.

MapmyIndia's RoadPilot is the next device in line. It looks like a military grade device, since the highly rubberized feel adds a whole lot of solidity to it. The bezel around the display is clean, but all ports are on the right spine - 3.5mm jack, SD card slot and Mini USB. Compared to the Satguide 4.3 Navi, the RoadPilot is compact yet thick.

MapmyIndia RoadPilot II Premium does not look anything like the lesser-priced sibling! Around the display is a dual toned finish - black and grey. The grey then runs throughout the device. No rubberized finish here, which is why the RoadPilot II Premium feels slimmer. The microSD slot is on the right side panel, while the Mini USB port is on the bottom, at one side. It feels slightly cheap in some places.

There is no denying the Primo GPS PG400X is possibly the shiniest baby navigator in this comparison test! The glossy black finish and generous use of chrome is a stand out. Overall, while well built, you will have to be careful that the PG400X doesn't get scratched.

The bigger Primo GPS device - the PG500X is an even glossier

MapmyIndia RoadPilot

package, so much so that we didn't dare leave it without the protective plastic layer once we had rated the build quality. From the front, you have the black bezel surrounding the display, with a chrome frame partly on the front and partly on the side. The rear panel is completely glossy black finish. The 3.5mm jack, TF card slot and Mini USB port are on the sides. Scratching it is a big worry.

When you pick up the MapmyIndia Vx140s Premium, you immediately realize its worth. Nicely rounded edges are enhanced by the bigger display size and has a classier rubberized finish. We think this has the most premium finish among all devices in this category.

The much-fancied TomTom Via 120 does come in with some really solid credentials from the experience people have had with it globally. The packaging of this device was by far the slimmest, its windshield mount integrated

on the device itself. A very neat idea. However, the implementation needs to be better. Speaking of the device itself, the two TomTom devices are by far the most unique looking ones in this bunch - power key on the back panel, no ports on the sides and the memory card slot in a tiny depression on the rear panel as well. The build quality is quite good, except that it loses out on points for power key placement.

Devices above ₹13,000

Built a lot like the Vx140s, the Vx240 does have that classiness about it. Similarly built, albeit a bit thicker, the Vx240 feels completely worth the price you spend on buying it, in hand or on the dash. However, it is a bit of an in-between device mostly because it is priced too close to the next in line - Zx250. We believe that the Zx250 is by far the most premium navigator from MapmyIndia. In a nutshell, built very well and the warm grey finish looks classy. In this price bracket, the MapmyIndia Zx250 is by far the best-built device.

The bigger brother of the TomTom Via 120 is the Via 125, and the bigger display is still encased exactly like the Via 120.

WINDSHIELD MOUNTS

We are tackling the issue of windshield mounts separately here, since they are a critical

element of the package that you will be paying for.

Satguide& Primo GPS

The windshield mounts from Satguide and Primo GPS are almost the same, and a bit of a mixed bag. While it is a good idea to have to have complete flexibility in terms

TomTom VIA 120

of height and angle the device is at, in this case, the tightened screws get slightly loose after some time, particularly for the arm that handles the face angle of the navigator - after driving over some bumpy roads. While there is no risk of the devices falling off, you may need to tighten the screws every few days.

MapmyIndia

Comes with an extremely solid windshield mount design throughout. It is also a two-piece setup, and literally no chances of things going wrong, since the one place where you tighten it won't ideally get loose. Fit the mount holder on the device.

Drop off a colleague after business dinner. Damn, the roads look so different at night.
