Monitors is a category where the notion, bigger is better, does hold true to some extent. What else can explain the fact that this year we received as many as six 27-inch monitors as opposed to just one in last year's monitor comparison test? The LCD vs LED backlit LCD monitor battle is pretty much in the past now, as most of the monitors we tested this time around were LED backlit LCD displays. There however was a variety in the panels such as twisted nematic (TN), vertical alignment

(VA) and in-plane switching (IPS). We decided to have monitors over 19-inches only, as we feel that is the minimum size you need to opt for if you aim to get an HD experience which has become a norm these days. Unless you are in office, it does not make sense to go for non-HD monitors for home use.

UNDER 22-INCHES

There were around six monitors in this category with most of them being 21.5-inch screen size except for the BenQ BL902 which was a 19-incher. The BL902 comes in a 5:4 aspect ratio and a native resolution of 1280x1024, which positions it as a good choice for office use,

where you will be working with a lot of excel sheets and documents, and you need extra vertical pixels. But the BL902 is definitely not meant for entertainment purpose. Build quality of this monitor is top notch. Of the other three BenQ monitors, only the RL2240H stood out thanks to its glossy white plastic body. In terms of looks, the other BenQ monitors were the same black bodies, sporting a matte-finish screen. The buttons for the OSD operation were well placed, the usability of the menu system is very good and it offers preset options such as Standard, Movie, Game, Photo, sRGB, and Eco. BenQ G2222HDAL only has a single D-Sub port for display,

which we found a bit strange considering it is a full HD display. The GL2250HM makes for a more better option than the G2222HDAL for a bit more.

LG Flatron E2290 was the showpiece in this segment, thanks to its extremely slim form factor. At 7mm thickness it is the thinnest monitor we have tested in a long time. It has a shiny silver finish and the display ports are recessed deep under the monitor stand. The power and OSD buttons are touch sensitive and located on the stand. Only tilt movement is offered. There are only three preset options namely Movie, Internet and Normal along with some photo effects such
