

Google Nexus Tablet

Rumours of a co-branded Google tablet have once again surfaced online, scheduled for arrival later this year.

Wacom launches Intuos5

The graphic design tablet has some cool new features, selling for a starting price of ₹17,200 <http://dgit.in/HVnmM2>

HTC One X

The ultimate Android smartphone, at the moment

for memory expansion. The HTC One X uses a micro SIM, instead of the standard SIM that we are using in our phones, mostly.

In the real-world usage scenario, the One X feels like any dual core powered smartphone, for the most part. However, most apps load quicker, and games are definitely a smoother experience. But despite having 1GB of RAM, there is never more than 250MB of free RAM. The background processes, and lots of them for that matter, eat up a whole lot of RAM.

The 4.7-inch Super IPS LCD2 is definitely among the best we have seen in smartphones, if not the best. The colour temperature is on a lighter side when compared side by side with an AMOLED display, but takes the advantage in terms of wider viewing angles and infinitely crisper text. Brightness levels are quite superb as well, and so are the black-level depths.

Cameras in most smartphones flatter to deceive, but this one is probably the best of the lot. And it can easily stand up to the one in the iPhone 4S. No need to change modes between photo and video by toggling the slider. What this does is reduce one step in the process, and saves on switch-over time. Photo quality is much better than expected - dollop of crispness and no noise. Videos recorded on this are an absolute delight to watch. There is absolutely no jitter in panned shots, and the camera isn't overly sensitive to light changes. However, when zoomed in, you will notice that

the colour tends to blow out a bit around the edges of certain objects. Contrary to fear, the video quality or the still images don't get spoilt in burst mode.

The interface is probably the biggest change over the older gen HTC smartphones, and that's because Sense 4.0 seems to have been built from scratch. There is a conscious effort to tone down the visual punch of the UI, something that allows more focus on the redesigned look of Android ICS. However, you can't move between screens in a circular fashion, and once you reach screen 7, there is no auto swipe to screen 1.

Battery life is a disappointment. With a quad core processor under the hood and a 4.7-inch display to light up, the 1800 mAh battery will struggle to survive through the day if your usage is anywhere above minimal and light. With Wi-Fi or 3G connected, an hour of voice calls spread through the day, mails syncing and a bit of chatting on FB Messenger, the phone lasted just about a day.

This is probably the best Android smartphone you can buy, at least in terms of raw performance. The display is one of the best around, and so is the camera. Disappointments are the battery life, and HTC Sense that tends to crash or become sluggish at times. HTC have been at it for so long that it is a miracle that Sense still isn't as optimized as it should be! However, you will be buying a phone that is a premium product, feels that way, and performs that way, at least for the most part. Or else, just get an iPhone!

Vishal Mathur

The HTC One X is a looker. Even though this falls squarely in the big-screen smartphone category, the One X isn't uncomfortable to use or unwieldy to hold. To understand most elements of the design influence, you need to look at the phone placed vertically on a flat surface, from side on. What you will also notice is slight curve on the top and bottom. The only issue with this slimness is that the 8MP camera protrudes out at the back, and when placed flat, the phone rests on a part of the clicker. While it is plastic throughout, we believe it is the unibody design that lends it the solidity.

A 1.5GHz quad core processor powers the HTC One X, and this is the first super phone to be launched in India. Not to forget, this is paired smartly with 1GB of RAM.

There is 32GB built-in storage, out of which the user gets about 25GB. However, there is no memory card slot

Specifications

Platform: Android 4.0.3;
Processor: Tegra 3 quad core 1.5GHz; **RAM:** 1GB; **Display:** 4.7-inch Super IPS LCD2 (1280 x 720 pixels); **Storage:** 32GB, no memory expansion slot; **Camera:** 8MP with 1920 x 1080p (1080p) videos; **Battery:** 1800mAh
