Canon Powershot SX240HS

Great travel zoom compact but priced slightly higher

The Powershot SX240HS is an upgraded version of the popular compact travel zoom camera - the Powershot SX220HS. On first glance, the Powershot SX240HS looks very similar to its predecessor the SX220HS and also sports the same 12.1MP back-side illuminated CMOS sensor. But there are some incremental changes such as the latest DIGIC 5 image processor, the optical zoom has been bumped up from 14x to 20x zoom and finally there are around four IS modes.

Build quality is quite sturdy. On the front face of the camera you have a finger grip whereas the thumb rest is missing on the rear side. The 3-inch 461,000

dot LCD screen is the same as the one seen on the SX220HS.

In our ISO tests, the detailing in the overall scene is quite good upto ISO 800, although one does notice a slight bit of noise at ISO 800 at 100 per cent crop, the image is still usable. Base ISO performance is very good. When compared with the SX220HS, we noted that the performance at ISO800 was better

for SX 240HS than SX220HS. We were quite impressed with the video performance of the camera specially indoors. While the SX 220HS had some noise issues indoors, the SX240HS suppresses that quite well. The low light mode shoots up the ISO to high levels thereby giving you a photo that is patchy with noise in many parts.

The SX240HS is a great travel zoom camera, but we just felt the pricing at ₹19,995 was a bit on the higher side despite the free 4GB SD card. Makes for an ideal purchase if you are looking for a good travel zoom on the market.

6.0/10

Features	6.0
Performance.....	6.0
Build Quality	5.0
Value for Money	6.0

This is a budget Android ICS tablet, and the build quality betrays the price tag of the tablet. It is plasticky all around, and that feels quite low quality. Build needs to be improved. On the spec sheet the Zync Z-990 looks impressive - a 1.2GHz processor and 1GB of RAM. Despite that, the benchmark scores and the usage experience clearly shows that the tablet isn't as quick as it could have been. However, the Z990 handles multi-tasking very smoothly. Zync should optimize the Z990 a little better to iron out the lag issue.

The 7-inch display has a 480 x 800 pixel resolution. The brightness levels are quite good,

even though the colour reproduction isn't vivid. In terms of video playback quality, both are the same. HD videos were smooth, and even jumping for-

ward and back in playback was handled very smoothly.

Annoyingly, the Z990's display hasn't been optimized. Put an app shortcut on any of the homescreen, and chances are they will only be half visible at the top. Quite clearly, a part of the display wants to escape! Battery life is very similar to most budget Android tablets out there - 5 hours of continuous video.

This is an ICS tablet that looks quite impressive on the spec sheet. However, in real life, it has been a disappointment. The build quality needs a relook. Little niggles like an un-optimized display, no Bluetooth and no volume rocker limit the tablet experience.
