LG 42LW6500 Cinema 3D

A 3DTV sans the clunky glasses

This 42-inch 3D LED television has a Full HD The edge-LED spec has the Local Dimming feature which helps improve black levels. The passive glasses are noticeably lighter and slimmer than the active shutter ones. However, results were a mixed bag. we got a splitting headache after 15 minutes of watching The Dark Knight in 3D. The wider-angle capability is something that will work when families get together to watch 3D TV.

We got a contrast ratio of 700:1, which is definitely good. With HD content, the crispness really kicks in, and if you have set the Black levels to the deepest and

Advanced contrast to low, you will be able to appreciate the overall colour depth. Blu-ray playback was excellent - no artifacts or edge noise.

When up-converting to 3D, the depth surprised us, in a good way. But, with up-converted content, there will be issues - ghosting and a definite

loss of crispness, but only at certain times. However, original 3D played back flawlessly.

The Magic remote depends on motion gesture to help you navigate the menu on the screen. We found this will very useful

when browsing web pages on the built-in web browser.

The biggest complaints against 3D television - headache and eyestrain have been addressed by LG by implementing passive glasses. We still recommend a demo before buying.

Sound is something that always divides opinion. It is quite difficult to find headphones that manage to keep most of the demographic happy. Sennheiser's HD 439 does come incredibly close to doing that and at a price that doesn't burn a hole in the pocket.

From the outset, the 439 does have a chunky design, but is quite lightweight. It fits well over the ears, and the generous cushioning helps if you are going to wear these for a long time. During tests, we wore them for 4 hours at a stretch, and they weren't the least bit uncomfortable. The generous space for the ears to fit in is very welcome. While they aren't noise cancel-

ling, the snug fit does block out the ambient noise considerably.

Like most Sennheisers' the HD 439 isn't bass heavy. But critically, the thump response is tight. This headphone focuses more on low-mids, and they are incredibly clear. Having said that, we did not at any point of time feel that they are too sharp, or unbearably treble heavy on the ear. Which is why we had even specified earlier that the HD 439 does seem to be walking the middle path. Getting back to the point of bass, it doesn't really show its hand unless you want it to. On an iPod Touch

with the No equalizer setting, the sound was soft and vocals clear. You could distinctly make out the bass, but for the purists, it was just the perfect dollop. Change the equalizer setting to bass heavy, and the thump does come in a lot more quantity. However, at no point did the HD 439 become "bass heavy".

The Sennheiser HD 439 has almost everything going for it. It isn't pricey, it is very comfortable to wear and the sound should appeal to anyone and everyone who doesn't want a bass heavy set of cans.
