

The GameSave Manager is pretty easy to use and understand

their list of games. You can take advantage of this feature to back up not only games that aren't supported, but possibly also non-game related stuff such as custom game patches, your gaming mouse setting, downloaded game trainers walkthroughs or even non-game related content. They can both also back up registry entries for a game.

This feature can be accessed in SaveGameBackup.net as follows:

- Click on tool icon to open the custom entries dialog
- Click on "Add Entry" to open the dialog for adding custom locations

On GameSave Manager, click on the "Custom Gamesave Entries" link on the left. Clicking on "Add" on this page will take you to a wizard that will let you configure your game save and registry locations. You can even submit these for inclusion in a future version of the software.

MASGAU also supports custom entries, however it needs you to configure the game's settings using an XML file.

Sync your save files to the cloud

If you want to automatically back up your game saves to the cloud, you can do that quite simply by combining one of the above software and a sync application.

All you need to do is install a synchronisation software such as Dropbox, SugarSync or SpiderOak, and then backup your save files to a directory that's automatically synced.

GameSave Manager particularly has good support for DropBox, and can automatically use it for syncing save files.

"Sync & Link" with GameSave Manager

GameSave Manager also supports an interesting feature called "Sync & Link". This brilliant feature essentially moves all your game save folders to your one directory. It creates links to the original game save locations so you can still play your games and save them nor-

mally, your games shouldn't know the difference.

This has major advantages. First of all, all your saves are now in one convenient location. Secondly, if you sync this folder with Dropbox or some other software, it will automatically sync your latest save files, no need to run a backup each time.

Use the MASGAU Monitor to create backups automatically

One less explained feature of MASGAU is the monitor component. Once you've set up the software, i.e. set up the games you wish to backup, the destination of the backups etc. you have access to this feature.

SaveGameBackup.net is simple, and doesn't allow scheduled backups; SaveGame Manager, on the other hand, can schedule backups. MASGAU can also do this and it supports something much better. MASGAU can back up on schedule too, but it also includes a small optional Monitor application that will automatically detect when your save files have changed, and run a backup.

It can optionally create a copy of all your save files to your Dropbox – or other sync software – sync folder so your

saves will be synced as soon as you exit the game.

MANAGE FIREFOX PROFILES

All your Firefox settings, bookmarks, history, saved passwords and even add-ons are stored in a profile folder in your User directory. When you install Firefox for the first time, it automatically creates

MASGAU supports some complex features – not apparent from its simple UI

this as a new profile for storing all your data. Little known is the fact that Firefox can support multiple profiles and switch between them on launch.

In fact, any Firefox-based application (Thunderbird, SeaMonkey) supports multiple profiles and some of these tricks will work on them as well.

Create multiple Firefox profiles

Hidden away behind a command line option is the ability to create and manage multiple Firefox profiles. Simply add the "-P" command line parameter while launching Firefox, and you should see a dialog that lets you create new profiles, and delete / rename existing ones. If you're running a 32-bit version of Windows your command line would be as follows:

```
C:\Program Files\Firefox\firefox.exe -P
```

Each profile will have a separate history, set of bookmarks and add-ons even. If you're using multiple versions of

The Sync and Link feature doesn't support some games
