Licensing BB10 Software

RIM says it may license its software to other manufacturers or even sell the hardware division in 2013 <http://dgit.in/100ceOu>

Cooler Master Silencio 650

Mid-tower cabinets between ₹5,001 to ₹10,000

This is a sweet spot for most buyers as this range has impressive cases which provide most of the features one can ask for without burning that proverbial hole in your pocket. There are some cabinets in this category which are big enough to support XL-ATX or E-ATX motherboards making it easy for buyers to choose them instead of paying for an expensive full-tower. It should also be noted that most of the cases in this range have good cable management features.

Corsair Carbide 400R

The Carbide 400R has superlative build quality along with a very professional but functional design and a great paint job. Its front panel is meshed and has two white LED fans pre-installed and its top is raised to make way for a handle which enables you to carry the case around. Its side panels are pro-

truding more than any case we got for the test. These panels are sturdy and have rubbered fan mounts on them. The included fans provide a good deal of airflow inside the case. You can mount a 240mm or 280mm radiator at the top of the 400R too.

NZXT Phantom 410

Out of the two Phantom cases which we got from NZXT, the Phantom 410 is a mid-tower and also a newer version of the original Phantom. The front and the top of this case is mostly made of plastic but the inner frame of the case is solid steel. We liked its bevelled design. A push-to-open door hides the 5.25-inch drive bays. The left side panel is divided into a see-through window and a grill for fan mounting. There is lots of space to manoeuvre around inside the case. You can even install a fan on the drive cages which has a pivot to switch the direction of airflow towards the GPU or CPU areas.

Cooler Master HAF XB

Straight out-of-the-box you will notice that the dimensions of this case are very different from standard mid-towers. It's because this case also doubles up as full-fledged test bench. Being from CM's HAF series of cases, its design is still primed for maximum airflow. This can be seen as it has a big meshed grill at its front with pre-installed fans. There are also two hot-swap drive bays at the front. There are handles at its sides to allow you to carry the case conveniently. Its motherboard tray can be removed just by unscrewing four thumbscrews. The front-portion of the case can also be used to install a 240mm radiator for liquid-cooling.

may notice with this case is that it has a huge acrylic side-panel window with silicone grommited fan mounts. The front of this enclosure is completely meshed and has slits on both the sides to complement its design.

The right-side panel has space for mounting a fan which will be behind the motherboard tray. Upon opening the Eleven Hundred, you will see that it has a molex powered internal fan-hub and an option to turn off the top fan LED. A bundled front-fan would have lowered the temperatures inside this case but it's still one of the few cases in our test which are big enough to house XL-ATX boards.

Antec Eleven Hundred

The Antec Eleven Hundred is a mid-tower in a full-tower's disguise. The first thing you

Cooler Master HAF - XM
