well. It also has a small removable bracket at the bottom for installing 2.5-inch drives. Front has a 2.5-inch hot-swap bay called the X-Dock. There are dust filters everywhere in this case which makes it easy to keep it clean. This is a good case indeed.

NZXT Phantom 820

Being NZXT's flagship case, it has a futuristic design to it along with a host of amazing features. Its build quality is great and it also has a raised-steel stand. It can accommodate a 360 mm radiator at the top, a 240 mm or

280 mm radiator at the bottom, and the rear fan can be slid up or down to directly be in front of the CPU cooler. It has lights on its back I/O shield and PCI slots to make it easy to see in the dark. The included fan controller works like a charm. Its hue LED controller can be used to change the colour of lights inside and along the edges of the case to your heart's content. The bottom dust filters can be easily removed by pushing them and they pop out.

Cooler Master Cosmos II

This case is like the sports-car of PC cases. And the analogy extends to its price tag too. It is humongous, very heavy, but very well built. The handles at the top help in carrying it (provided you can lift it) and the base of the case is also composed of the same handle like rods but instead they're stands. Sliding the front cover down reveals the external drive bays. Forget thumbscrews, you just need to press down a lever at the back and the side panels open up. Both the side panels open like hinged doors. There is massive amount of space inside the case and there are two fans hinged together on the drive bays too. The top portion can be removed

to install fans or liquid-cooling radiators. If you have an itch for huge cases and ₹19,000 to burn then go for it.

Verdict

This bout goes to the underdog. Circle beat out the biggies to win the **Best Buy** award, but keeping its pricing in mind the **Herculean** edged past the next best contender - the Storm Trooper. The Herculean does offer a great feature set with a lovely design. Having said that the Cooler Master Storm Trooper was the only case in the test which managed to keep the test GPU temperature lower than all the other cabinets and we are fans of its stealthy design. So, if you can get the Trooper under ₹11,500, it's a great buy too.

Overall best performer

Every once in a while an unlikely upstage happens in our performance tests. For instance you may be surprised to know that a case from our lowest price bracket won the **Best Performer** award. But numbers don't lie. The **Cooler Master HAF 912** won it for having the lowest overall temperature spanning all categories of our test. A good case to go for considering its not costly too.

The editors pick

NZXT Phantom 820 won the **Editor's Pick** for having a great overall score and being consistent in both its performance and features. This case was the second biggest case in our test after the CM Cosmos II. The Phantom 820 was followed closely by the Cooler Master Storm Trooper in most of the parameters and is also a very good case to get considering its cheaper than the Phantom 820 and also has similar features. 

NZXT Phantom 820
