The ME Ultra looks fairly standard as most other ultrabooks, but its build quality and overall solidity are disappointing. There is a fair amount of flex everywhere on the chassis. What is really worrying is the amount of bend on the keyboard. Move the lid, or change the tilt angle, and you get a fair amount of flex on and around the display hinge.

The 14-inch screen has a matte finish – so thankfully distracting reflections are not present. Colour reproduction is not very vivid, but the text clarity is good, without noise. The keyboard does not have a sharp response that would be conducive to quick typing. The benchmark tests clearly peg the Dell Inspiron 14z as a

Price
₹51,440

better performer than the ME Ultra. The Dell Inspiron 14z's PC Mark Vantage score of 7404 is much higher than the 5558 that we get on the HCL ME Ultra. The fact that the Inspiron has a dedicated graphics chip as well makes it a more versatile machine. We were quite impressed with the battery life offered by the ME Ultra. It lasted 207 minutes from full charge to complete discharge in our stressful battery test which involves playing a video on loop.

The HCL ME Ultrabook is directly competing with the Dell Inspiron 14z. Between the two, the Dell ultrabook seems to be a better deal in terms of features as well as performance.

iball Andi 4.5h

Budget Android phones finally coming of age

We are seeing a lot of budget Android phones sporting higher specs. We saw it last month in our phablet test. This time around we got our hands on iBall's latest – the Andi 4.5h – a 4.5-inch IPS LCD panel sporting phone housing a dual-core processor, 8 MP rear camera, 960x540 pixel resolution and more. The white-colored Andi 4.5h has a great build quality and a hint of chrome around its top and bottom edges. Opening of the rear cover is a bit of a task as the notch is located at an unusual position.

It runs Android 4.0.4 and you get a stock ICS experience. Call quality on the Andi 4.5h is quite good with decent volume levels and optimum sound clarity, but we did not like the delay in response when you click on the End Call icon. The display is one of the best

₹12,490

parts about this phone. The screen despite being reflective is still readable under sunlight on adjusting the brightness. Blacks aren't as deep as we would have liked. The iBall Andi 4.5h has a decent 8MP camera. The major issue is autofocus speed. We did not like its video mode at all as it shoots in the 3GP format and lacks quality.

Coming to battery life, the phone sports a 1600mAh battery which will easily last for around 9-10 hours a day on regular usage and around six hours on heavy usage. It takes quite a while to charge though which we did not like.

The iBall Andi 4.5h is a much better improvement over the iBall Andi 5c. Decent performance, good build quality coming at a sweet pricing of ₹12,490 makes it a great bang for the buck.
