Saying that Canon has come late to the mirrorless game would be an understatement. Canon has been taking their time to put out a product that would take the market by storm. Unfortunately, the truth is actually quite the contrary.

The EOS M comes with an 18 MP APS-C CMOS sensor with a Digic 5 processor. The sensor is the same as the one in the 650D, at least as far as specs go, with the same pixel count and the hybrid AF. Given all the similar innards, we felt that the EOS M would give a performance that would at least match the 650D's, but we were in for a few surprises.

The image quality of the EOS M images, in our opinion is definitely better than that of the 650D. The colors are more vibrant and the RAW files give

₹49,995

about 1/3 of a stop worth of room for adjustment over the 650D. We also found the EOS M's low light performance to be, incredible.

As good as the images from the EOS M are, we found the autofocus on this camera to be incredibly crippled. It was bad enough that it wouldn't

lock focus sometime, but what was worse was the camera confirming the focus was locked when all we saw on the screen was a blur. Shooting in low light like clubs required us to adjust focus manually if we needed to get a useable image from the night. Lack of a competent focus system on a camera that Canon has had years to develop is extremely disappointing. However, if you're ok with manually focusing all your shots, then the EOS M will give you some stellar photos for sure.

Fujifilm X-E1

Big things in small packages

The X-E1 has a 16 MP APS-C sensor complimented by the EXR Processor. It's designed as a rangefinder camera, but unlike the bigger X-Pro1, it doesn't include a hybrid viewfinder. Instead, the X-E1 has an electronic only viewfinder with a 2.3 million dot resolution. The screen on the back is a 2.8 inch with a 460K dot resolution which is surprisingly good, even under the bright mid-day sun. Ergonomically, the X-E1 has a rather hard-cut rectangular shape, and may not be to everyone's liking.

We spent a lot of time shooting with the X-E1 at parties and our general outings and for once, it was nice to not have to shoot in RAW. The X-E1 does an amazing job at metering the light just right, which is something we had a tough time achieving on the X-Pro1.

The film simulation modes on the X-E1 are present and we personally love the look of the Velvia film, so needless to say we had many of our images follow that look. The new 18-55mm f/2.8-4.0 optically stabilized lens is actually really good in itself and that is not something we often say for kit lenses.

The X-E1 does take amazing photos, but we had issues with the AF. It's actually pretty fast and incredibly accurate, but moving the AF points around was quite annoying. The only way to change the AF from one point to the next is using a combination of the AF button and the direction buttons. We really wish there was an easier way. This makes our love for the X-E1 a little less. But that wouldn't stop us from getting one for ourselves.
