.NET vs Java... What side are you On?

I have successfully learnt a lot from both of the worlds, in the last one year. Now doubt raises on what side a person should be...

Java - The heated cup

- 1) J2SE Being the core I thought that this would be awesome to learn, much better than C++/C Cool concept of JVM (Java Virtual Machine)
- 2) JSP Servlets the level two of Java and the answer to all the web CGI Scripts today,
- 3) EJB the sellers choice
- 4) J2EE the world today, with frameworks aka Spring, Struts, Hibernate, More MVC and ORM tools (Still not gone through but will sooner or later one day) one has to learn a lot before in order to go through and understand these
- 5) The JSF Now...

pros: Cross platform, Opensource, Free IDE's all around making good start.
cons: If you go further (to learn any Framework) you have to learn a lot earlier

The wave of Microsoft .NET

Now this actually turns out to be the same, having technologies, concepts being nearly the same

- 1) The programming Fundamentals: It seriously depends on what have you started using with VB (Visual Basic.NET) being the most awkward syntactically but easy to learn, C#.NET syntactically same like Java, But under Windows CLR (Common Language Runtime) Concept same as the JVM, But I dont find the applications running on any different OS other than Windows itself. Partly hyped in our textbooks about Cross Platform isn't it?
- 2) ASP.NET the .net's answer to the Web in terms of the the Web applications But still, Linux having a history in being secure, . Would you go for Windows?
- 3) WPF (Windows Presentation Foundation)

pros: Easy to learn enough if you have learnt some OOP earlier, please list few if you have some.
cons: Limited to windows, MicroSoft (if you know what i mean to say), IDE's Costs, Free version available but with lesser bells...

On what grounds would you like to go with any of the worlds,

lastly what preference would you like to give... In other words If rated these sides what rating would you like to give them in 10, I dont want an argument/ debate here just a fine talk on what you think on either of these technologies...? Your ideas views...

If it is a programming preference, A language can be learnt in a span of a week if you have a background in any of the Object Oriented Programming...

If its a preference of speed: Then I would like to add that speed in your application majorly depends on coding practices, If you make a mess in the design of your code, It is obvious that there will be a dramatic decrease in your app's speed...and pointing that decrease to any of the company is not fair enough on a programmers end.

Good thoughts / views Welcome..

Guide to make strongest passwords

Here I am posting this ref. to an excellent SANS guide on simple ways to make your passwords stronger, yet still remember them:-
http://www.sans.org/reading_room/whi...ation/1636.php

A reliable alternative is to use a password manager program. Two of the better ones:

KeePass Password Safe

Password Safe | Free Security & Utilities software downloads at SourceForge.net

But just remember if you let someone access your files and PC, it is no longer really your PC.

One way to reduce the risk is to encrypt sensitive files so they cannot be accessed by someone. One program that does a decent job of this is Truecrypt
TrueCrypt - Free Open-Source On-The-Fly Disk Encryption Software for Windows 7/Vista/XP, Mac OS X and Linux

Plants some trees.

Spoiler: [show](#)

Re: Guide to make strongest passwords

The first link doesnt work buddy...
Anyways the trick I use is to take two things I like and join them with one or more special characters.
Lets say you like jalebi and lassi => jalebi&lassi

Its simple and its very easy to remember for you but not for someone else. And tbh, I have never really found the need for anything more secure than that

HP Pavilion dv4 3016tx | i5 2.33 GHz | ATI HD6750M 1GB | 4GB RAM | 500GB HDD
Grado SR601 | Panasonic HJ120 IEM
Nokia N70 | Sony Ericsson Eperia Ray | Coming up : Lumia 920
Canon EOS 600D 18-55 Kt lens
