

15,000 apps for BB10

A big number of apps flooded the BB10 atmosphere suggesting that the number of developers for BlackBerry10 is on a steady rise

New Star Wars movie

"Star Trek" director J.J. Abrams is rumoured to be directing the forthcoming "Star Wars" movie. <http://dgit.in/WqKkSf>

thousand years of painstaking, careful writing as the anomaly," said UC San Diego Professor Nicholas Christenfeld. "Modern technologies allow written language to return more closely to the casual, personal style of pre-literate communication. And this is the style that resonates, and is remembered."

The report goes on to say, "In the first two experiments, participants' memory for Facebook posts was found to be strikingly stronger than their memory for human faces or sentences from books—a magnitude comparable to the difference in memory strength between amnesiacs and healthy controls. The second experiment suggested that this difference is not due to Facebook posts spontaneously generating social elaboration, because memory for posts is enhanced as much by adding social elaboration as is memory for book sentences."

"Our findings might not seem so surprising when one considers how important both memory and the social world have been for survival over humans' ancestral history. We learn about rewards and threats from others. So it makes sense that our minds would be tuned to be particularly attentive to the activities and thoughts of people and to remember the information conveyed by them."

Facebook envy

German researches have come up with a new study that reveals social media envy is a real thing and is leaving people with negative feelings such as loneliness, frustration and even anger. The study titled 'Envy on Facebook: A Hidden Threat to Users' Life Satisfaction?' is based on a survey of 600 people in Germany. The study goes on to say the social media envy is making people feel less satisfied with

their own lives. Respondents admitted they were frustrated and envious after visiting the social networking web site.

The study noted users who browsed Facebook without participating in any sort of active conversations are the most affected by such negative feelings. Friends' vacation photos on social the networking site is among the top reasons for the frustration, the study found. Such negative feelings can "frequently" cause users to work up their Facebook profile and boast about recent successes to compete with friends. This however, causes jealousy among other users, which researchers dub as the "envy spiral".

Google Asia Servers

Internet users in India and other Asian nations will soon experience Google's services such as web search and YouTube streaming at about 30 percent faster speeds as the tech giant's new data centres installed in Singapore, Taiwan and Hong Kong are slated to go operational this year.

According to an Economic Times report, Lalitesh Katragadda, country head, India products at Google, notes web connectivity speed in India isn't very high. "These data centres will be crucial to this market due to its proximity," he adds. The

Google official admitted that several Google services including its video sharing site YouTube and video conferencing service Google Hangouts weren't accessible at optimal speeds in the country right now.

A report from web-based content delivery firm Akamai Technologies says India is at the 112th position globally in internet speed. India is among the largest markets for Google with the nation having more than 100 million users. "More people from India are coming online every day and this is an important market as Google looks to bring the next one billion online," Katragadda added. "We plan to invest disproportionately in India in the coming months and years."

Mega resurrection

Kim Dotcom has announced a new file-sharing network, Mega, with 50GB free storage. This comes on what is the first anniversary of his arrest on charges of racketeering linked to the now defunct Megaupload.com. The network has already clocked 1 million registered users within 1 day of the service being rolled out for users globally.

Dotcom stated that his lawyers had examined the new network thoroughly and is confident that it complies with all security and anti-piracy norms.

Every file uploaded by a user will be encrypted and there are enhanced levels of privacy for uploaded and stored content.

Mega, just like Megaupload.com, allows users to upload, store and share files with other users. As per the announcement, there are two methods of signing up for the Mega service. The free account offers 50GB storage, with the full gamut of sharing capabilities. It is interesting to note that the free option offers more than what the likes of Dropbox and Skydrive offer, and additionally, Mega also offers the similar convenience of the drag and drop upload tools.

Unfortunately, soon after launch in mid-January, the service was unreliable, and people have been unable to log in the system easily. Kim Dotcom tweeted that he apologizes for the poor service quality as his servers were not prepared to handle such traffic for the start-up.

Chrome 25 beta

The beta version of Google's web browser for Windows has been released with the Web Speech API, letting users control more than just search, with voice commands. The browser is currently available for Windows users. Announcing it, Google said, "Using your voice to search on your computer or phone is handy, but there's so much more you can do with voice commands. Imagine if you could dictate documents, have a freestyle rap battle, or control game characters with your browser using only your voice. With today's Chrome Beta release, this future is closer than you think."

Apart from the voice control feature, Chrome 25 will bring in security and performance enhancements for all extensions, a new search and tab page and better HTML5 support.
