Capcom's new game – Dragon's Dogma: Dark Arisen is expected to release of April 23rd

Atari files for Bankruptcy

Atari, one of the oldest names in the gaming scene has filed for bankruptcy in the U.S. and is selling all of its assets

Beef up the ramp

With the rise of cyber-terror and new vulnerabilities being found daily, the connected world is a minefield without a map. We take a fly-by

Security is a continual struggle to maintain integrity, in the face of countless possible attacks. It is a struggle that can never be won, unless the system under threat is absolutely closed, both in the electronic and physical sense. Vulnerability is constant, with new patches and holes being created nearly simultaneously.

In a scenario like this, preparation will only get you so far, with fast reactions and adaptations recourses all must resort to. Since we met last, innumerable players have made even more numerous changes to their systems. Preparations are being made as well, with the Indian government amongst those gearing up for a bleaker future.

India's cyber security architecture

In a bid to deal with the sabotage, espionage and other forms of cyber attacks, the Indian government is developing the national cyber security architecture. The facility will be also responsible for safeguarding the country's information infrastructure and networks as well as offering certification to service providers and vendors to ensure additional security measures.

The revelation was made by National Security Advisor, Shivshankar Menon, who said: "It will also involve capacity and authority for operations in cyber space. The goal is to prevent sabotage, espionage and other forms of cyber attacks that could hurt us."

The National Security Council has okayed the archi-

tecture in principle even as the implementation details are being chalked out with the ministries and agencies, "which we hope to take to the Cabinet for approval soon", Menon said. A national cyber security coordinator in the National Security Council Secretariat (NSCS) will be responsible for bringing this work together.

Google's updated Chrome extensions

Google's cracking the whip on rogue extensions, by tightening the noose around the way extensions are installed in its Chrome browser. Up until recently, vendors of software could silently install Chrome extensions, without requiring any input from the user. Google has found that this feature of Chrome has been getting widely abused, so in Chrome version 25, the ability to silently install an extension will be taken away.

Any software that requires a Google Chrome extension to be installed will now have to prompt the user for permission to not just install, but also enable the said extension. Another security feature being built into Chrome 25 will essentially disable all extensions installed on Chrome, and will require to be re-enabled by the user.

Falling Spam

According to Kaspersky Lab data, share of spam in e-mail traffic slumped to 72.1 percent in 2012 – lowest in last five years. The share saw year-on-year fall of 8.2 percent as compared to 2011. Kaspersky Lab says the slump in spam volume

is due to improved anti-spam protection in e-mail systems and implementation of DKIM signature policies that verifies the domain from which e-mails are sent. The slump is also due to availability of affordable advertising on legal platforms.

The proportion of e-mails with malicious attachments was very less though as such e-mails had 3.4 percent share. The data ranks China as the top source for spamming, as it accounts for 19.5 percent of all spam mails. India ranks third behind the U.S. with 9.7 per-

cent. Overall, Asia accounted more than half of the world's spam. The report says India is among top target for phishing sites as the country ranks sixth. The list is dominated by developed countries.

India Transparent

According to Google's latest 'Transparency Report', India stood second with as many as 2,431 requests for data about 4,106 users. The U.S. topped the list with 8,438 requests for information about 14,868 users. France, Germany, Britain and Brazil filled out the top six. "[The data] shows the steady increase in government requests for our users' data continued in the second half of 2012, as usage of

our services continued to grow," says Google in a blog post. "User data requests of all kinds have increased by more than 70 per cent since 2009. In total, we received 21,389 requests for information about 33,634 users from July through December 2012."

Anonymous' Warning

The hackers group, Anonymous, has said it is going to continue its campaign against web censorship in 2013. The group released a statement warning the world to "Expect us 2013". The group has also released a video featuring its campaign and strikes carried out in the year 2012. The video includes the group's temporary shutdown of the various US sites in protest of the US government's indictment of the operators of popular file-hosting site MegaUpload.

The video also features the group's campaign against Syrian government sites over alleged shutdown of the Internet. It also shows Anonymous' campaign against the Israeli government to protest the latter's attacks on Gaza. "The operations which are listed in the video are only examples, there are far more

operations," Anonymous wrote in the statement. "Some of them are still running, like Operation Syria. We are still here."
