

Demystifying 48 fps

We throw light on The Hobbit's "HFR" movie format and wonder whether the future of filmmaking is in 48 fps

A "Privacy Visor" ?!

A group of Japanese scientists are developing a pair of glasses that can protect you from Facial Recognition Machines

Sonic Screwdriver

Some people say that Doctor Who is the James Bond of science fiction, although Mr. Bond uses quite a lot of fiction himself. But looking past that, we would say that the huge army of fans that the show has garnered will surely appreciate the fact that somebody has actually gone on to prepare the Sonic Screwdriver, which the Doctor uses for exactly the same purpose as normal people would use a screwdriver – absolutely anything. Lock-pick kit to tracking a bunch of nasty aliens, this promises to do anything that the writers can decide on. And it will do none of those things in real life, of course. But it is still a good piece of the show memorabilia, and would work for you as a trusted universal remote. Yours for some 5 grand, plus shipping. Check out www.iwantoneofthose.com.

Tesla Model S

We are including this car not only because we love cars, but because of the previously unimaginable horizon that this particular manufacturer has brought very close to reality – a car that is eco-friendly without feeling like one. This piece of art on wheels, the "moonshot" Tesla Model S has been painstakingly in development for years, and was finally unleashed late last year. Costing around ₹60 lakhs, which is actually on the lower side considering its impressive stats, this car will fit the standard definition of a 'sports car' for the people who love those (basically everyone in the world), and is powered entirely by batteries, to keep the green army happy as well. Not an easy agreement to achieve, as most luxury car manufacturers would tell you. But we salute Elon Musk for his attempts, and bow down to the moonshot that is his creation.
