

Star Wars VII gets a director

And it's none other than J.J. Abrams, who made a name for himself writing, directing and producing the hit show *Lost* and the *Star Trek* movie

Dating site finds iPhone

A man used an online dating site by creating a fake profile to lure the thief who had stolen his iPhone. Full story here: <http://dgit.in/TMEMIH>

Drool maal

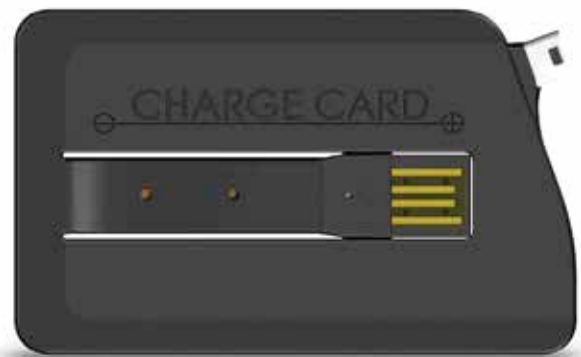

.338 Lapua Magnum

Geeks are a very predictable bunch. If you ask them for their ideal lives, you would probably get a roughly even distribution between the Matrix and James Bond movie environments. Favourite games would probably throw up Quake, Call of Duty and the ilk. What if we told you that there are parts of the above fictional worlds that are coming to life? AND they are powered by your favourite operating system – Linux? Please wipe that drool off your face, you might drop some on the page. So here is a setup that has an iPad that would pair with your gun's scope, and would allow you to actually 'lock' on your targets, take all weather conditions into account, and fire a shot so jaw droppingly awesome that you absolutely cannot miss. As an added benefit, there is always the good feeling of living like an open source soul, even if it will cost you ₹11,00,000, although that is not way off creating the same setup yourself. So a good deal, all in all. If any of you would actually like to have one of these, you should be looking at www.tracking-point.com

ChargeCard

If you travel extensively, you obviously know the pain of not being able to sync up your devices if you don't have the heavenly blessing of an internet connection around you. A neat little Kickstarter project called the ChargeCard plans to remove those woes once and forever. They have introduced a small chip that can be carried around with you, in your pocket, which supports the God of modern connector cable – Micro USB. And it has not left the rebels out as well – here's one for the iPhone too! The entire concept is effortlessly easy, but very cool. All you need to do is to take up the card, plug it into one device, have the sync material stored, and then plug it to your other device. Simple as that, and will only burn a ₹2,000 shaped hole in your pocket.

Scanadu Scout

As it turns out, NFC is pretty native to our natural bodily structuring. At least that is what the guys at Scanadu believe, and that is the vision in which they created their nifty device called 'Scout', which can measure a bunch of your vital stats by simply holding it right next to your temple. Anyone remember the Star Trek medical tricoder? We seriously feel that the writers of that show were among the greatest visionaries in the modern day, unleashing the imagination of millions of geeks to go out and make the imaginary concepts of the show a reality. And they do so at a price that is not exactly worth drooling about – that part is taken care of by the idea itself. Check out www.scanadu.com, and in their own words, have your smartphone go to med school. Only for some 10 grand.
