

Open Source manual for Pi

A group of teachers from the UK have released an Open Source educational manual for the Raspberry Pi with a license from Creative Commons. <http://dgit.in/VDnnus>

Q&A

I have a problem with my computer's date and time settings. Whenever I start my PC, there comes a page asking me to press F1 and run setup or press F2 to load default values and continue. So everytime I have to run the setup and then continue, which is very time consuming. The date is shown as '01-Jan-02' and time is shown as '12:00AM'. Is this any type of a virus or something else? Please do help me.

Mohil Khare

A This problem generally occurs when you have made some recent hardware changes. The error you are getting is pertaining to CMOS. You can try clearing the CMOS by clicking on the clear CMOS button or changing the jumper settings when your system is off. Refer to your motherboard manual to check out which jumpers are used to clear CMOS. See if you get rid of the error. If not, then you will have to update the BIOS by downloading the latest BIOS from the motherboard manufacturer's website. If your date is constantly changing, then remove the battery for some time from the motherboard. Reinsert it and then set the date in the BIOS.

Partitioning woes

I need help regarding partitioning my laptop hard drive. My configuration is as follows:

- Model: Samsung Notebook3 NP305E5Z - S01N
- CPU: AMD A4 1.96GHZ Dual core
- RAM: DDR3 4 GB
- Hard Disk: 500 GB
- VRAM: AMD Radeon DDR3 1 GB

How do I effectively partition it without defragmentation? And how should I exactly do that? How many partitions can I have? Also I have plans to install Linux (dual boot) on a separate drive, so please guide me according to that.

I have installed Windows 7 32-bit version and the problem is, its using only 2 GB out of the 4 GB installed RAM. How do I use the full RAM capacity?

Purushoth

A To create partitions, you can go to Start > Run > Create and Format hard disk partitions, but make sure you have sufficient space on your 500 GB drive.

This will show you all the drives that are there on your system. We are assuming you have only one drive at present without any partition. So say C drive is showing as 450 GB. You right click on it and select shrink volume and enter the capacity which is lower than your free space. So for instance if of the 450 GB, you have around 200 GB of free space, then enter the capacity for shrink volume under 180 GB. This will create another volume and you will need to reboot.

The simplest way to try out a new OS is to use Ubuntu. The distro is available on the Feb 2013 DVD and only needs to be mounted via a tool such as Daemon Tools (also on the DVD). Then all that needs to be done is to run "Wubi.exe" from the DVD. Follow the instructions and Ubuntu will be installed within Windows without the need to create a partition.

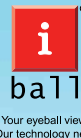

The second alternative is to partition the HDD using Windows's in-built partitioning tool. Press the Start button and type "Create and format partitions" to open the program. Use it to shrink a volume and create a new partition from the free space. Make sure that you create a partition that is at least 20GB in size if you want to try out a new OS.

Next create a bootable pen drive using the "rufus" tool from the Feb DVD or search for it online. The other option is that you can burn the image file to a DVD using any image burning utility. Instructions for creating a bootable Ubuntu pen drive can be found at <http://dgit.in/WcTjH8>. The method will be similar for any other distro.

You can either set your PC to boot via the USB drive or DVD depending on what medium you used for creating a bootable image, then follow the installation instructions for the distro you're using.

Most linux distros have very clear instructions but be warned that some don't and if you do not follow the instructions or don't know what you're doing, you can very easily delete your Windows partition or damage the installation in some other way.

Since you have a 32-bit version of Windows 7, you cannot use 4 GB or RAM as there is a limit on 32-bit OS. Installing a 64-bit version of Windows 7 will utilise all 4 GB. **A**

Element of Success

Add a little attitude to all your presentations with iBall's 2.4GHz Wireless Presenter. Probably the most powerful presentation tool an executive will ever hold!

2.4GHz
Wireless
Trackball
Presenter
with laser pointer

- Built-in laser pointer.
- USB Micro Receiver.
- Left & Right button for Previous & Next Slide.
- Toggle button to switch between two applications.
 - On/off switch to save battery life.
- Can be used as a mouse with Trackball & Left click button.
- Blank Screen button to draw attention towards the speaker.

iBall Lappie™
Enhancing laptop computing.
