

it to any unsuspecting child. Despite their best attempts, you'll notice that the device refuses to return to the Home screen despite repeatedly pressing the Home button.

To get out of Guided Access mode, you have to type the passcode that you initially secured your device with. Hopefully, this passcode will be a well-guarded secret.

Disable ad tracking

Apple has restored control back to the user as far as privacy is concerned in iOS 6, by allowing users to decide on their own whether they want marketers to track their browsing habits to direct targeted ads to your iOS device.

Crack the whip on ad tracking services. Crack it hard!

If you dislike adverts targeted at you, just go to Settings > General > About in your iOS 6, and scroll down to Advertising. Tap and then slide on the "Limit Ad Tracking" feature to help prevent inquisitive online marketers from bombarding you with targeted ads on your iOS device.

Also, as far as the device's general privacy goes, Apple has added a dedicated Privacy field under General settings. Clicking on it lets you access various sub-features like Location Services (which tells you which third-party apps are accessing your device's location data), and more. In fact, you can even regulate the level of access granted to your Twitter and Facebook

data through this dashboard, and completely revoke access to OS-wide social media services.

Multiple email signature

Email signatures are absolutely essential to have, whether you're responding to official work email or personal mails from your iPhone or iPad. It's part of email etiquette, basically. And if you're in the habit of ending mails sent from your different email accounts with the same signature, iOS 6 has come to set the record straight and rescue you from this habit.

With iOS 6, each one your linked email account can now have its own unique signature – that's right. Good riddance to the dull and boring default "Sent

Account-specific sigs FTW!

account. Like we said, no more "Sent from an iPhone", please.

Reply/Remind with Phone Calls

How cool would it be to spare yourself the trouble and actually let your phone remember what missed calls you'd like to get back to? With iOS 6, Apple lets iPhone users do just that in a simple and straightforward fashion.

Normally, when you get an incoming call on your iPhone, you see the standard choices, Decline or Answer, displayed in bold on the lock screen. But if your iPhone runs on iOS 6, you can access an additional flick-on menu that comes into view when you flick the screen from bottom to top.

You see now two additional buttons displayed below the Decline or Answer buttons – Reply with Message and Remind Me Later. The first of those two additional options lets you quickly reply the caller

Reply with a message or set a reminder for incoming calls

with a customized message with the click of an additional button, while the latter lets you choose between postponed call-back reminders on your iPhone which will prompt you to return the call at the time of your choosing.

Offline reading list

Apple also effectively combines the power of its iCloud sync service and a feature from its Mac OS X Mountain Lion build to introduce a nifty feature in iOS 6 – Reading list. It's basically an offline reader for synced and saved web articles.

When you're on a long, interesting Web page that you'd like to read during your commute back home, just tap the Share button in Safari's browser to reveal a menu. Select Add to Reading List from the bevy of options displayed, and you can now effectively save a complete offline copy of a web page (with images, formatting, etc) as is for deferred reading. You'll see the reading glasses icon while the article is uploaded on iCloud.

This is a great feature for those of us who have a non-data equipped iPod touch or Wi-Fi only iPad – basically anyone who can't connect to the Internet on the go. Next time you're in office, all you have to do is add interesting articles to your Reading list and you're done.

CHROME

Apple's popular adage that "there's an app for that" which they largely meant for mobile devices like the iPhone and iPad can be tweaked to "there's an extension for that" and applied to most popular Web browsers these days. Here we take a look at hand-picked Google Chrome extensions that enhance your time on the Web and optimize your browser experience. There's also tips in there to
