

With extensions like MagicScroll Web reader or iReader, you can have a smooth, uninterrupted reading experience.

- Install MagicScroll Web reader
- Visit a website page
- Click the MagicScroll “book” icon in your browser to pull and display the text in plain, nothing else.

iReader works in much the same way on Google Chrome, transforming interactive Web pages into clean, serene book pages with just a white background and text. Make the most of your online reading sessions.

Delete browsing history

As you well may know by now that Google Chrome (any other of its competitors) saves browsing data in chronological order (unless you surf the web in Incognito Mode). But how do you do more than just what default options Google Chrome offers? Find and download History Eraser from Chrome’s web-store to get things rolling.

- Click on the eraser icon on the top-right corner of Chrome to launch History Eraser’s app window.
- Apart from giving you basic features that Chrome’s default History mechanism offers (clear cache, delete cookies, delete browsing data, etc), History Eraser has a whole lot of other filters to carefully tweak and delete every facet of your browser activity from the records.
- What’s more, with this extension, you can prevent the default Chrome history page from showing up – just tick the option in History Eraser’s console and try hitting Control+H to no avail.

This extension is highly recommended for one-click actions you want to take on your Chrome’s browser history.

App management

Just what do you do when you have too many apps and extensions installed on your Chrome browser? You install another extension called Nexus (from the webstore) to make sense of all the other plugins installed and available on your PC.

Nexus is an offline app which helps you organize everything from your bookmarks to your extensions and apps. Not only this, it also comes with built-in support to connect and access Google+, Facebook, YouTube, Gmail, Flickr, GitHub, Vimeo and Google Drive account all through its console.

- Install and access the Nexus app through a new tab.
- Its home screen shows management options like Apps and Extensions, Bookmarks, Images, Videos, etc.
- Click on the Settings gear wheel on the top-right.

Nexus is a basic app manager for Chrome

- You will now see the Connections view of Nexus, handling your Facebook, Flickr, Gmail, Google+, etc., connections.

With Nexus installed in your Chrome browser, you can pick and choose which apps and extensions you want to keep active or disable.

And also its connections menu feature lets you easily access data from your various social network and email accounts in one convenient place. Give this a try and see if it adds to your browsing experience.

The Summer Chrome extension is great for additional research

Meta info

There’s a nifty, little-known extension for Chrome that scans every webpage you visit for the mention of popular personalities. Upon encountering names that it cross checks with entries in its vast database, it quickly lets you know that you can know a lot more about them... without opening another tab! Now isn’t that wonderful?

That’s what Summer is all about. According to its official description, “Summer makes it easy for online users to get a comprehensive and informative snapshot about people, companies and other topics they find interesting within pages and articles they visit across the web.”

- After you install the extension from Chrome’s webstore, just access any random webpage.
- If Summer finds names of people or companies mentioned on the page for which it has additional info, it will slide-in its logo from the right-side of the screen as an overlay, trying to grab your attention.
- Clicking on it will drop down a column along the right-side of the browser with names Summer found on the page.
- Click on any one of the names to access additional info about the person or company.
- The additional info Summer offers include Wikipedia bios, related video, news

summary from various sources, Twitter buzz, links to official website, and more.

The biggest asset of Summer is to give you all this rich info about subjects it finds right there on the same page, as opposed to our usual habit of opening a new tab and Googling the subject ourselves.

Night vision

Staring at bright computer screens displaying white as the dominant colour can make your eyes weary in no time. And the problem is amplified when you sit in a room where your PC’s screen is the only light source illuminating your immediate surroundings. For all the night owls out there, who spend way too much time online in front of their computers in the dark, here’s an extension just for you.

- Install this extension from Chrome’s webstore.
- After installation, click the moon-like black and white orb icon visible in the top-right corner of Chrome.
- Select from Normal, Increased Contrast, Grayscale, Inverted Color, and Inverted Grayscale display options, as per what you find comfortable.
- Apply a setting. You can even customise a particular setting for a website, forcing it to open with one of these filters applied whenever you access that site.
