

Install it and give this a try, your eyes will thank you later!

Tweak performance

- Over time, Google Chrome has garnered a reputation of being quite heavy on system resources, clogging up CPU cycles and taking up generous amount of RAM (like a boss!). This behaviour is even more magnified on systems running on older hardware or low-end PCs that are low on system resources in the first place.
- A common trick devised to address this is by allowing the GPU to take over some of the processing tasks by accessing Chrome Experiments in the browser. Just type “chrome://flags” in the URL bar and press Enter and you’ll see a whole new tab with a list of experiments available for Google Chrome. Scroll down to locate “GPU

by clicking on the top-right button > Settings > Advanced Settings > Uncheck “Automatically send usage statistics and crash reports to Google” under Privacy.

- Clear browsing data from time to time to avoid a lot of clutter from stacking up and hampering the browser’s performance. Go to Settings > Advanced Settings > Hit the “Clear browsing data” button to do some spring cleaning. Doing this once a month is recommended.

SUBLIMETEXT

If you haven’t heard of Sublime Text, you are missing out on what is possibly one of the best text editors available today. Sublime Text is a simplistic text editor with an uncluttered UI a beautiful interface, and a powerful keyboard driven interface. It has very rich keyboard short-cuts that make reaching for the

The command palette is one of the best features of Sublime Text

is a list of commands and their corresponding short-cuts, if any. The best thing about this list is that it is searchable. If at any point you want to perform an action, and you do not know the keyboard short-cut for it, simply open the Command Palette, and start typing the name of the action.

Let’s say you want to convert a sentence from normal case to title case. Open the command palette and type “case”. You should see a number of options for converting between different cases.

Install the Package Manager

Installing packages for Sublime Text is simple enough, and just requires one to copy the package files to the Sublime Text packages directory. However there is a better way that integrates with the Sublime Text editor – Sublime Package Control.

Sublime Package Control is a package manager that allows you to download, install, update, and remove packages directly from Sublime Text. Of course you need to install the package manager itself first, but that too is simple enough. Visit <http://dgit.in/SHszAW> for installation instructions.

Once it is installed, you will notice new commands for managing packages in your Command Palette. Press Ctrl+Shift+P and then type “install” and you will see “Package Control: Install

Package” as one of the options. Select it and after a short wait you will see a searchable list of packages you can install.

Plug-ins

Now that you have the package manager, there are a few plug-ins you just need to install:

- Prefixr:** If you work a lot with CSS, this plug-in is a must have. It automatically adds the correct browser prefixes to CSS properties.
- Sublime Alignment:** This neat plug-in allows you to automatically align your code to the same indent level or align assignments around the “=”
- SFTP:** If you want to work on code directly on a remote FTP server.
- BracketHighlighter:** Automatically highlights starting and ending brackets around a code segment.
- Emmet:** Formerly known as Zen Coding, this is a highly condensed way of writing HTML or CSS code.
- OmniMarkupPreviewer:** If you want to use light-weight markup languages like Markdown or Textile, this plug-in is must have. It exports such mark-up to HTML and shows a live preview in your browser.
- CodeIntel:** This plug-in adds support for code auto-completion, function call tool-tips, and jump to definition, bringing it closer to an IDE.

Sublime text has a clean and neat interface that is focussed on text editing

- compositing on all pages” in the list and select “Enabled” from the drop-down action. Also enabled “Threaded compositing” for good measure.
- Google Chrome anonymously collects stats to send crash reports back to the development team to make the browser better. However, turning off this feature can give you a minor performance benefit. Launch Chrome’s drop-down menu

mouse unnecessary. It is also highly customisable and extensible with its own plug-in API.

Command Palette

Probably the most powerful feature of Sublime Text is the Command Palette accessible by pressing Ctrl+Shift+P. Think of it as a command line for Sublime Text.

When you use the aforementioned shortcut, what you see
