

>>we ensure we have maximum features available on XMS >>

>>Sunil Shetty, Mobile Developer, eBuddy

eBuddy as an alternative to text, is old. What's your expectation from the future?

Although eBuddy Chat has been available since 2003, we launched an XMS real-time messaging app for smartphones in March 2011. We expect people to increasingly use instant messengers leaving behind text messaging.

There is no dearth of applications these days, as there are phenomenal levels of fragmentation across platforms. How does XMS stand out?

It is very well agreed that there is a huge chunk of specialised messaging platforms available in the market now and XMS is also a part of those applications. Therefore we ensure we have maximum number of features available on XMS, such as allowing users to chat cross platforms, ability to communicate via text, pictures and video. We also have a web companion to our app, so that a user can have the option of having the ease of using the big desktop screen if required.

Is the mobile app native, or is it a web interface? What is the mechanism behind XMS?

All our mobile XMS client apps are native. We also support a browser-based version which works on tablets, called WebXMS. Our mobile apps open a socket (either plain or TLS) to the XMS backend services to handle the messaging when the application is on the foreground. When the application is off (or on the background depending on the mobile platform) we rely on the Push Notification services provided by the mobile platform.>

>>You've been following devworx every month as you enjoy your favourite technology magazine. With your support, devworx has been on a steady rise, and is discovering its identity with you – the reader – the developer. While on one hand, it's an extension of your most trusted brand – Digit; on the other, it's tailored for application developers in India.

Whether you're an app development company based out of India, an application developer, or simply an enthusiast – you are nonetheless, a catalyst in India's growth as a software development powerhouse. Be it the Large Hadron Collider at CERN, or the Curiosity Explorer currently roving across Martian terrain,

Indian technologists and developers are a very close part of cutting edge innovation across the globe. We want to help you innovate!

devworx is an attempt to recognise such stories in software innovation, early on! Irrespective of where you stand in the scenario illustrated, we invite you to be a part of us. Whether you're an established app development company, a policy maker influencing the mobile ecosystem, or an individual developer, there's a lot to share with the community. We eagerly want to hear your story. Write to us today! Visit www.devworx.in and go to the Contact us and Careers pages for further information. You can also email us at editor@devworx.in.
