

Linux kernel 3.8 released

The latest release improves performance, saves disk space and even includes support for some of the latest SSDs and other hardware. Find out more at <http://dgit.in/YDsXJ1>

What makes a website fast?

Just what exactly makes a website lean, mean, and perform as fast as it can? This handy infographic answers that question <http://dgit.in/ZijzL7>

Agent 001

of the question and we also couldn't be too extravagant with the mouse. After much searching, we finally settled on the Logitech G105 keyboard and Cooler Master CM Storm Recon mouse. We got the former for about ₹3,000 and the latter for about ₹2,500. The G105 is a good keyboard with everything that is required of a gaming keyboard (except mechanical keys), including backlight, 5KRO and even macro keys and all this in a reasonably priced package. The CM Storm Recon is also an excellent mouse and we really enjoyed playing with it when we tested it last year. Looking around at all that fancy gaming gear got me more than a little excited and even a little tempted. I thought about my trusty old Razer Abyssus and the dusty Logitech K100. Then also thought about the new games releasing in March and how nice it would be to play on a nice new keyboard and mouse. The vision was too strong, maybe it was my lack of sleep that brought down

my innate defense against splurging but I finally caved. I left my friend at the shop to pay for his purchases (making sure he was in his senses of course) and dove into a nearby shop where I had spotted the Corsair K90 and ROCCAT Kone some-time ago and ended up with an account that was ₹12,000 lighter but with an ear-to-ear grin that would put the joker's own slashed lips to shame.

The keyboard set me back ₹7,400 but boy was it worth it. Featuring a lovely, rugged, brushed aluminum finish and more macro keys than I would ever need, not to mention backlighting and an on-board volume controller and USB-Port, this was the ideal gaming keyboard for me. I was tempted to take the BlackWidow from Razer but the price and design swung in favor of the Corsair. The mouse, the ROCCAT Kone is, more than anything else, one of the most comfortable I've ever used and being a large mouse, it fits very comfortably in my hands. People with

smaller hands might prefer the adjustable R.A.T.5 or even the Corsair M90. Impulsive splurge over, I hurried over to my friend who, because the initial tension was over, had relaxed a bit and after browsing through the store's catalogue, had picked up a Razer Orochi to go with his Alienware laptop. I couldn't really fault him for the purchase. The Orochi is an excellent mouse and while a little expensive (₹4,000 approx), it is a very good mouse and portable as well. The Bluetooth functionality works well enough for normal browsing and general PC usage and the wired mode of operation transforms it into an excellent mouse for claw grippers.

Shopping finally over, two satisfied geeks returned to their homes. One with an odd mixture of relief, high hopes and gratitude, the other with a drugged (lack of sleep, remember?) sense of elation and satisfaction at a job well done. This had been something of a long day, but it was well worth it.
