NVIDIA outs the GTX TITAN

NVIDIA took the curtains off its flagship single-GPU GeForce GTX Titan which is based on the GK110 GPU and features GPU Boost 2.0 and Display Overclocking

Graphics card and PSU

My PC configuration is as follows:

- Processor: Intel G630 2.7GHz
- RAM: Kingston 2GB
- Motherboard: Gigabyte H61
- PSU: Local Supercomp 450W
- Monitor: 17-inch CRT
- HDD: 160 GB 5400 RPM
- OS: Windows 8 Pro 32-bit

I am looking for a new graphics card in the market. Unfortunately I have been unable to find anything better than the NVIDIA 520GT locally, and that too costs nearly ₹3400. My priority is better gaming frame rate at 1024x768 resolution and even lower, at med to high settings or even a low details would do. I want to play games like Battlefield 3, Assassin's Creed 3, Hitman: Absolution.

My max budget for the GPU is ₹4,000 and can be extended to a max of ₹300 more. I am leaning towards the XFX 4850 512 MB. I also want to get a new PSU.

So my questions are:

1. Which GPU should I get?
2. For the HD 4850 will the older specifications of DX 10.1 and 512 MB do?
3. Any suggestions about better cards, better merchant sites, better PSU's and anything are welcome, but within the constraints.

rune.scape44q

A The HD 4850 is certainly a more powerful card as compared to the others you have mentioned. But it is also an older card and heats up much more than the newer cards on load. For the settings you will be playing at it is a decent card. But it does not support DX11 so if that is not an issue for you, go ahead and get the HD 4850. Also it has 512MB of video RAM and the games you have mentioned have a recommended setting of 1 GB video

Sapphire HD 6670

memory and minimum memory of 512MB. So these games will run on HD 4850, but the experience may not be as good.

Games like BF3 need a good amount of video RAM. If you are getting a 1 GB model of HD 4850, then it's a good deal. Else you might want to check out Sapphire HD 6670 (<http://goo.gl/GdsOU>) which has decent video RAM and can easily play BF3 and other games at the 1024x768 settings. The maximum TDP of HD 4850 is 110 Watts, so the Corsair VS 350 can handle the HD 4850. Better to go for branded PSUs than local ones. You can check out primeabgb.com, smcinternational.in and theitwares.com

Budget phone query

I am reading this magazine since the last seven years and I still feel it's awesome.

I want to buy a good touch screen phone. My budget is around ₹10,000. Actually I have three recommendations that are: Micromax Canvas 2, HTC Desire C and Sony Xperia Tipo. I am leaning towards Micromax Canvas 2, but can I trust this brand? How is their customer care?

Keyur Paralkar

A Yes, the Canvas A 110 is a really good phone. We have heard an overall positive feedback from customers that have used it. We have however also heard about some complaints when it comes to after sales service but these are far and few. We think the A110 is a good phone and you can go for it.

Micromax however has announced the Canvas HD A116 which is priced at under ₹13,990, if you are interested in owning the latest and greatest, you can take a look at the A116. you may have to increase your budget though.

Android 4.1 phone

I want to buy an Android 4.1 phone under ₹10,000. I also want to be able to game on the device and be able to customise the UI to my liking.

Shashi

A If you are looking specifically for Android 4.1 you're narrowing your options. As of now, the ₹10,000 price point hasn't seen the launch of devices

Micromax Canvas HD 116

running Android 4.1 Jelly Bean. There is however the Karbonn Smart Titanium I. The device is priced at ₹10,990. We would suggest that you wait till reviews of the device are out before making your purchase decision.

Graphics card conundrum

I have an AMD Radeon HD 6670 and I want to buy a new card at a sub-10K pricing. I want to stick to AMD and I have short-listed some cards but it is getting increasingly confusing when it comes to selecting one card out of these. Here's the list:

1. Powercolor AMD HD 7770 1GB GDDR5
2. HIS H777F1G2M 1GB GDDR5
3. Powercolor HD 7750 1GB GDDR5
4. MSI R7770 Power edition 1GD5/OC 1GB
5. HIS Radeon HD 6870 IceQ X GPU 1 GB

Sourish Banerjee

HIS HD 6870 IceQ X

A Among the cards you have mentioned, the HIS HD 6870 IceQ X makes a for great buy if it's under 10k. It offers better frame rates than HD 7770 despite it being a generation older. Also the IceQ X version of the HIS card will ensure that the card does not heat up on load. It offers much better cooling than a regular HD 6870. **d**
