

Free iPad Minis

LinkedIn CEO, Jeff Weiner, handed out free iPad minis to about 3,500 full-time employees of LinkedIn

New OUYA every year

The Android based game console, OUYA will follow a release cycle similar to mobile phone releases, one each year

tions which can travel through bones near your ears are used to transmit audio to your ears thus enabling you to listen to the sound around you while you are also listening to audio from the glasses.

The FCC application includes information about the device having 2.4GHz 802.11 b/g WiFi and Bluetooth 4.0. There is also a description of the device having a reference to an "integral vibrating element that provides audio to the user via the user's head" which points out that Google Glass will indeed use bone conduction technology.

Google Glass Bone Conduction Patent

A few weeks back, Google also filed a patent for indirect bone conduction technology based on wearable computing devices. Other manufacturers such as Panasonic displayed their functional bone-conduction technology based headphones at CES this year which shows that some companies are developing devices and improving their products based on this technology at a fast pace.

Microsoft reports \$6.38 bn in profits, despite slow sales of Office

Microsoft has just announced its Q2 earnings for the 2013 financial year and though the company managed to rake in \$21.5 billion, \$6.38 billion of which is pure profit, the numbers seem to be less than previously expected. The dip in profits is being attributed to the impending launch of the next MS Office Suite, Office 2013.

While overall profit numbers look good, with each Redmond share closing at \$0.76, one cent higher than the \$0.75 analysts had predicted, the somewhat impressive sales numbers of Windows 8 were definitely offset by the slowing sales of the company's current-generation productivity suite. While Microsoft Office 2013 has already been made available to the enterprise subscriber base, the consumer build of Office 2013 was slated for a January 2013 release, so it's quite expected that the soon-to-be-outdated version of Office would not rack up impressive sales figures.

However, Office wasn't the only department with disappointing numbers due to an impending launch. It is being reported that the Entertainment and Devices division also saw a dip in earnings, raking in \$3.77 billion during a strong holiday season, but 7 percent lower than the figures from the same time last year. This is being attributed

to many people holding off on purchasing an Xbox 360, given the rumours that Microsoft may be announcing the next-gen version of the console at E3 this year.

Intel set to launch Internet TV service this year

Intel has confirmed that the company will be launching an Internet TV service sometime this year. The announcement was made at the All Things Digital's "Dive Into Media" conference.

The company is said to be in negotiations with content partners at the moment. What is confirmed though is that Intel will ask users to buy a set-top box, which will stream live TV and movies. "We have

Intel Insider Internet TV

been working for (the past) year to set up Intel media, a new group focused on developing an Internet platform," Huggers said. "My kids may watch programming geared towards them, and I'll watch programming geared towards me," Huggers said, according to AllThingsD. "If there's a way to distinguish who is watching what, advertisers can then target ads at the proper parties."

Reports of Intel working on a streaming service were first covered by the Wall Street Journal in March 2012. But, it will be interesting to see how Intel works around certain issues. The first being to convince users to buy a separate set top box for this service. The second is licensing issues, and the geographical restrictions in the way of global play. The third is how Intel gets around the bandwidth caps that ISPs tend to put on connections, globally.

Adobe releases source code for original version of Photoshop

What if we told you could download, install and use

Photoshop for free, and that too legally? You'd think we've gone completely bonkers, right? As unbelievable as it may sound, it's true. The only catch is that this version of Photoshop was released in 1990 and was the first ever Photoshop to see the light of the day.

An arrangement was recently arrived at between the Computer History Museum and Adobe Systems recently which made this possible. The Computer History Museum further announced that all the 128,000 lines of code, except the MacApp applications library for the Photoshop Version 1.0.1 are available for download.

The release contains 179 files in a zipped folder, comprising of mostly uncommented but well-structured lines of code. Out of the entire collection, about 75 per cent of the code is in Pascal and 15 per cent is in 68000 assembler language.

Adobe Photoshop 1.0.1

The major part of the original source code was written by Thomas Knoll (Photoshop co-founder). The aim of the first version of Photoshop was personal use but later on the product went on to be a commercial success and is now one of the most widely used graphics editing software in the world.
