in Google ads appearing on Yahoo websites. The deal seems to be a win-win situation for both the companies as Yahoo gets relevant ads on its website and Google gets a larger platform to display its ads. The deal comes seven months after Marissa Mayer took the chair as CEO of Yahoo. Marissa Mayer was formerly one of Google's top executives. Yahoo's official blog post on the deal reads, "Today, we're excited to announce that we recently signed a global, non-exclusive agreement with Google to display ads on various Yahoo! properties and certain co-branded sites using Google's AdSense for Content and Google's AdMob services."

Yahoo is changing its strategy

"By adding Google to our list of world-class contextual ads partners, we'll be able to expand our network, which means we can serve users with ads that are even more meaningful. For our users, there won't be a noticeable difference in how or where ads appear. More options simply mean greater flexibility. We look forward to working with all of our contextual ads partners to ensure we're delivering the right ad to the right user at the right time."

The advertising will be on a more contextual basis – something we've come to see in Google ads as well as on Facebook. If you're searching for shoes, or clothes or a new TV set, the ads that will appear will be relevant to your search instead of something irrelevant like property or hair care. This

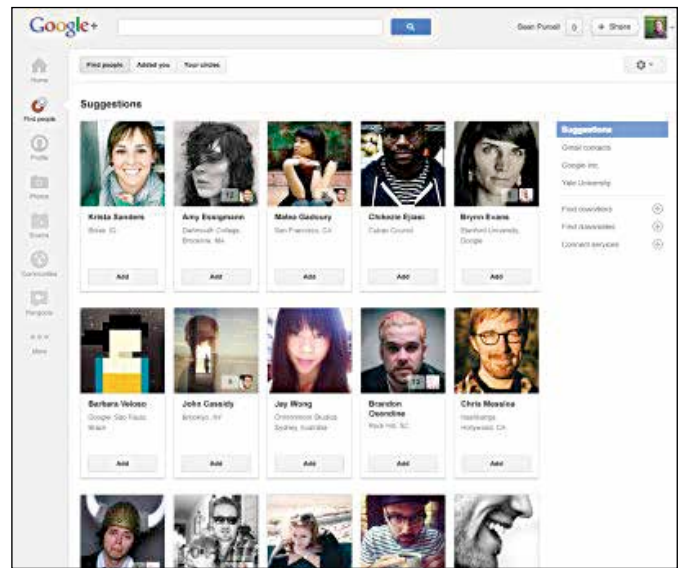

relevance makes it easier and more likely for a user browsing the internet to click on the ad.

Broadband tariffs may go up under new proposed license framework

The tariffs of broadband and internet services in India could be heading skywards soon, if the proposed license structure is implemented. The Department of Telecommunications (DoT) has proposed a one-time license fee of ₹15 crore, as compared to the ₹30 lakh applicable at present.

Under the proposed licensing regime, DoT will allow service providers to offer internet telephony (VoIP or Voice over Internet Protocol) service, which will help offer low-cost call services in rural areas. In 2010, private players Reliance Infotel Broadband, Tikona Digital and Augere had won Wireless Broadband Spectrum (BWA). The committee gave the recommendation that the ISPs with BWA be allowed to provide voice telephony service, but has left it to the higher authorities to take a call on whether these companies need to pay the ₹1,650 crore extra.

The government has given the option of continuing with the old license format, which runs in parallel with the new national level UL that will cost ₹15 crore. All licensees who wish to offer any additional services will have to migrate to a unified license. For example, Reliance Infotel had acquired Wireless Broadband Spectrum (BWA) spectrum and an ISP license in 2010. But the company will have to pay ₹1,650 crore if it wants to offer voice services using this spectrum. The existing license doesn't allow that.

Google Plus 'Circles' becomes 'Find People'

70% of Indian YouTube users below age of 35: Google

According to an online survey conducted by Google, about two-thirds of the YouTube viewers in India are below the age of 35 years, while 72 percent have a college degree or higher. Moreover, one-third of viewers in the country access videos on their mobile phones and spend more than 48 hours a month on YouTube, matching the global trajectory, as per the survey.

Google's survey was conducted on more than 2,000 Indian YouTube viewers. With

YouTube is doing lots of stuff

the survey, Google has also coined a new section of viewers called 'Generation C' – a young and tech-savvy group of people, who are connected with the latest in content and culture.

According to Danielle Tiedt, VP Marketing, YouTube, Generation C thrives on the 4Cs – creation, curation, community and connection. Generation C is deeply engaged with the online videos and spends hours of watching, creating and uploading. "Generation C switches between devices 27 times a day, and Indian users watch nearly 30 percent of their YouTube videos on mobile. Smartphone owners spend one-quarter of their YouTube time on mobile, while tablet owners spend about 20 percent," says Google in its study. Google hopes smartphone penetration will increase in the country, which would allow the advertisers to directly reach out to the Gen C. The survey further revealed that more than half of YouTube Indian users share videos on the social networks, and about the same number of users share videos from the video-sharing site via email. Google's insights into India's users on YouTube clearly shows the growing popularity of the social video network in the country. The credit for YouTube's growth should be also given to the localised offerings by the search engine giant. **[1]**
