Is Our Online Life Private Enough?

Vishal Mathur

vishal.mathur@thinkdigit.com

“Digital etiquette: always ask permission before posting a friend's photo publicly. It's not about privacy settings, it's about human decency.” When Randi Zuckerberg (Mark Zuckerberg's sister), posts this on her Twitter feed, you know somewhere a line was crossed. This happened towards the end of 2012, when Randi, a former Facebook executive herself, shared a picture with her friends. One of them, Callie Schweitzer, Vox Media's marketing director, picked up the picture from her own timeline and tweeted it. Sadly, the picture went on to become news and got Randi some unnecessary attention.

The Human element: Private vs. Personal

This neatly brings us to the debate of what's private and what's personal. Taking the above example, it's easy to argue that the photograph was not shared in the “private mode” and was made public for all to see. However, what needs to be understood is that while the photograph was not private, it does attach with itself a strong attribute of being personal. This is particularly true when you're talking about a human being, or a personal possession that can be identified. While it's not a good idea to post per-

sonal pictures on the internet, sharing pictures after clicking them seems to be part of a preordained process to feed the online personality. But the rider is that the picture is being shared with a select bunch of people, by the choice of the person who's a part of the picture, and in some cases with the permission of the people being tagged in the picture. This is where the ability to think – something most of us are proud of – comes into the picture because downloading an image and tweeting it to God knows how many people, is surely intrusive.

Is everything on the internet public?

The counter question is – do I grab a picture of my friend from his recent night out with friends and run around town showing it to everyone? That would be plain stupid. This is exactly what Schweitzer did on Twitter. However, she's not alone in this mindless sharing of content on social networks; many of us do it.

The root cause of the problem is that whatever we see on the internet is believed to be “public” information. The fact that we don't translate unwritten etiquette of the “offline” world into the online world is baffling. No amount of filters and privacy settings will help unless we respect basic rights of people.

How many users actually know about 'privacy'?

Ignorance is a major problem when it comes to online presence. Users, who aren't exactly the most proficient with the way sharing every single update on the web works, may not know when to hold back. Earlier this year, IPSOS Public Affairs did a survey on behalf of Microsoft. As per the survey, only 4 out of 10 people believed that they truly understood what online privacy was all about.

But it's not just users and the content they share. Web companies are equally responsible for compounding the problem, and the success of any clean-up will largely depend on how these companies respond to allegations and proof of data tracking etc. Some of them claim they do the right thing, using flowery terms like “responsible”, “honest” and “fair”. But are they really? Articles from the not-too-recent past clearly indicate that they're far from it, no matter what they claim!

Have you noticed this?

If you've been using Facebook Messenger for a while now, surely you would have noticed the “read at XX:YY” update below every message you may have sent to the other person. Now, the flaw with this system is simple – you have Messenger open with FB in one tab while you're browsing on another tab. You may
